

# Engage2020

Tools and instruments for a better societal engagement in "Horizon 2020"

Grant Agreement no. 612281 Activity acronym: Engage2020

Activity full name: Engaging Society in Horizon 2020

# D3.2 Public Engagement Methods and Tools

Due date of deliverable: August 2014 Actual submission date: October 2014

Start date of Activity: 1 September 2013 Duration: 2,25 years

Author(s): the Engage2020 Consortium

Organisation name of lead beneficiary for this deliverable: Applied Research and

Communications Fund (ARC Fund)

# Introduction

It is nowadays broadly accepted that a comprehensive understanding of societal challenges as well as striving for socially robust and sustainable problem solving and innovation paths is dependent on the specific knowledge, the values and the interests of all involved societal actors. The need for broad consensus in society on research and innovation (R&I) policy and the growing criticism with regard to the management of risks and detrimental effects of the implementation of technologies led to a turn away from the established technocratic mode of governance in the field of R&I and technology to a new approach engaging the public at large by various participatory practices.

Societal actors can be involved at all levels of the R&I processes and R&I policy making. Increasing the use of engagement practices in research and innovation activities is beneficial to both researchers as well as the general public. Societal engagement is pursued for a few reasons. These are: *democratic* reasons –public engagement improves the democratic governance of science as citizens have a say on research agendas and policy frameworks in the field of R&I; *instrumental* reasons – engagement improves the research results and the relevance of policies by including societal knowledge, ideas and capacities in research and increasing the knowledge base for policy making. In addition, engagement improves citizens' awareness of science and technology development.

Societal engagement is one of the pillars of the framework for Responsible Research and Innovation (RRI), developed by the European Commission. The idea behind RRI is to improve the relevance of science in the EU to the societal challenges lying ahead of the European societies by including all societal actors throughout the whole process of research and innovation. The identified by the Commission Grand Societal Challenges, or, key issues the societies in Europe need to deal with, are:

- Health, demographic change and wellbeing
- Food security, sustainable agriculture, marine and maritime research and the bio-economy
- Secure, clean and efficient energy
- Smart, green and integrated transport
- Climate action, environment, resource efficiency and raw materials
- Inclusive, innovative and reflective societies
- Secure societies to protect freedom and security of Europe and its citizens

Thus, to meet the goals of Horizon 2020 with regard to these challenges, which stand at the core of Horizon 2020 Programme, any action will need to play an intermediate role with regard to three societal arenas: science, policy making, and the public sphere.

#### Engage2020 and its objectives

Engage2020 is a project funded by the European Commission (DG Research and Innovation) that looks into how members of society are involved today and, perhaps more importantly, how they could be involved in the future in science and science policy. The project investigates how, where and why societal actors such as consumers, employees, lay persons and others are being engaged in the research process, from early policy development to the delivery of research activities. The core objective of Engage2020 is to increase the use of

engagement methods by mapping what is practiced and to spread awareness of the opportunities amongst researchers, policy makers and other interested parties.

Public engagement in European research and innovation activities is relatively high by international standards, but it is unevenly distributed, both geographically and based on issue areas. The partners hope that Engage2020 will spread participative practice from the pockets of excellence, such as the foresight community and Science Shops, to wider groups. The current document aims to contribute to achieving this objective and help current and potential users of engagement practices to understand which methods they can use taking into account the different context they operate in, such as the different objectives they might have, different level of research and innovation activity, the different Grand Societal Challenges they would like to address using engagement practices and others.

#### The process of scanning and mapping of engagement methods and tools

With these objectives in mind, the project partners embarked on a challenging task to scan and map methods and tools currently used for societal engagement in research and innovation in Europe and beyond. The scanning was done via:

#### Step 1: Online survey for identifying engagement methods and tools

The online survey aimed to identify methods and tools and gather basic primary data from relevant experts on the range of practices currently employed for public engagement in research and innovation. The survey was distributed by project partners to their networks of contacts, including relevant professional associations. The result was more than 200 entries out of which 57 engagement methods and tools were identified.

#### Step 2: Factsheets

A factsheet template was developed to provide a framework for the information gathering on the methods and tools identified in Step 1. The data collection and completion of the factsheets was distributed among all partners. Partners completed the templates based on: i) their own experience with the respective method/tool; ii) the information and materials provided by the respondents of the online survey; iii) additional desk research and interviews with relevant experts whenever deemed necessary. To ensure the quality of the completed data, each factsheet was reviewed by another partner of the consortium.

The completed factsheets will feed into a databank/Action Catalogue of engagement methods/tools for current and potential users of public engagement practices, which will be developed at the later stages of the project. Both the factsheets and the new databank will provide a well-structured overview with a large variation of significant methods and tools for public engagement. They will help improving the understanding of engagement methods and tools, as well as allowing current and potential practitioners to take more informed decisions in terms of which methods and tools they can use in their specific context.

#### Mapping of engagement methods and tools

The methods and tools listed in the current document are mapped against a set of four criteria. These are:

- **the levels of application of the method/tool** (i.e. policy formulation, programme development, project definition, research activity)
- **the societal groups involved in the application of the method/tool** (i.e. CSOs, policy-makers, researchers, citizens, affected citizens, consumers, employees, users, industry)
- **the level of public involvement** of the societal groups listed above (i.e. dialogue, consulting, involving, collaborating, empowering, direct decision)
- **Grand Societal Challenge addressed** (i.e. Health, demographic change and wellbeing; Food security, sustainable agriculture and forestry, marine and maritime and inland water research, and the bioeconomy; Climate action, environment, resource efficiency and raw materials; Inclusive, innovative and reflective societies; Secure, clean and efficient energy; Secure societies protecting freedom and security of Europe and its citizens; Smart, green and integrated transport)

The four levels of method's application, namely policy formulation, programme development, project definition, research activity, cover the whole span of activities connected to science, research and innovation. Mapping of existing engagement practices against the four levels of engagement aims at promoting the wider and more inclusive engagement at all levels, and thus to strengthen the collaborative governance and democratic elements of research and innovation. The four levels may involve different challenges and therefore, different methods and tools may be of relevance to them. The four levels of engagement in more detail are defined as:

- *Policy formation* is the praxis of defining the framework conditions for R&I activities. This includes making policies for distribution of funds between programmes, rules and instruments on responsible R&I, definition of financial instruments etc.
- Programme development is the process of defining the content and the calls in R&I research programmes. This is typically a process involving member state representatives, programme committees, the research community, different platforms and hearing processes.
- *Project definition* engaging society may be about inviting different groups of stakeholders to suggest focus for the specific research or innovation project, thereby increasing the chance of acceptance in society or the chance of innovations to be welcomed by the markets.
- Engaging society directly in the research and innovation activities may be aimed at, for example, increasing the amount of empirical data for research, allowing for clarification of normative issues in the scientific process, or improving the relevance and thereby the implementation of research and innovation results.

The participant types embraced by Engage2020 will be those, who may have relevant knowledge, can contribute with normative clarifications or have special abilities to act or decide in specific domains. Special emphasis is put on those groups which are usually not embraced by research and innovation activities as collaborators, namely CSOs, citizens, affected citizens, consumers, employees and users.

In Engage2020, we focus on genuine engagement forms which go beyond traditional one-way communication of scientific findings. Thus, engagement practices which cover the following levels of public engagement have been included in the current document:

- *Dialogue* aims to improve the "two-way" communication between scientists, policy makers and citizens to ensure a regular exchange of views.
- Consulting aims to obtain public feedback for decision-makers on analysis, alternatives and/or decisions.
- Involving aims to work directly with the public throughout the engagement process to ensure that
  public concerns and aspirations are consistently understood and considered in decision making
  processes.
- *Collaborating* implies partnering with the public in each aspect of the decision including the development of alternatives and the identification of the preferred solution.
- *Empowering* happens when the involved participants acquire certain skills/knowledge in the process of engagement.
- Direct decision takes place when final decision-making is in the hands of the public.

The Engage2020 project will highlight engagement policies and methods which are suited to engaging members of society in research and innovation activities related to the specific Grand Societal Challenges, as outlines by the European Commission.

Based on the data collected, the following distribution of methods according to the four above mentioned criteria has been outlined:

	CSOs	Policy-makers	Researchers	Citizens	Affected	Consumers	Employees	Users	Industry
Policy formulation	Civic dialogue; Consensus conference; Delphi method; Future panel; Future search; Group Delphi; Interdisciplinary work groups; Interviews; Open space technology; Participatory strategic planning; Perspective workshop; Q methodology-stakeholders selection; Scenario workshop; Need survey among CSOs; World café; World wide views.	Civic dialogue; Consensus conference; Future panel; Future search; Interdisciplinary work groups; Interviews; Open space technology; Participatory strategic planning; Q methodology-stakeholder selection; Scenario workshop; World café; World wide views.	Citizens' assembly; Civic dialogue; Consensus conference; Crowd wise; Deep democracy-the Lewis method; Deliberative mapping; Delphi method; Distributed dialogue; Future panel; Future search; Group Delphi; Interdisciplinary work groups; Interviews; Multi criteria decision analysis; Open space technology; Participatory strategic planning; Perspective workshop; Q methodology- stakeholder selection; Scenario workshop; Needs survey among CSOs; World café; World wide views.	Citizen compass; Citizen juries; Citizens' summit; Citizens' assembly; Citizens hearing; Civic dialogue; Consensus conference; Crowd wise; Deep democracy - the Lewis method; Deliberative mapping; Deliberative (Minipublics, workshop; Deliberative poll (Deliberative polling); Distributed dialogue; Interviews; Multi criteria decision analysis (MCDA); Participatory budgeting; Participatory strategic planning; Perspective workshop; Scenario workshop; World café; World wide views.	Citizens' summit; Citizens hearing; Consensus conference; Deep democracy-the Lewis method; Distributed dialogue; Interviews; Multi criteria decision analysis (MCDA); Perspective workshop; Scenario workshop; World café; World wide views.	Citizens' summit; Consensus conference; Interviews; Open space technology; Scenario workshop; World café.	Citizens' summit; Consensus conference; Crowd wise; Deep democracy-the Lewis method; Interviews; Participatory strategic planning; Perspective workshop; Scenario workshop; World café.	Citizens' summit; Consensus conference; Interdisciplinary work groups; Interviews; Scenario workshop; World café.	Civic dialogue; Consensus conference; Crowd wise; Delphi method; Future panel; Future search; Group Delphi; Interdisciplinary work groups; Interviews; Multi criteria decision analysis; Open space technology; Participatory strategic planning; Perspective workshop; Scenario workshop; World café.
Programme development	CIVISTI; Civic dialogue; Comunity-based (Participatory) research; Consensus conference; Delphi method; Focus groups; Future panel; Group Delphi; Interviews; Knowledge atelier; Open space technology; Participatory strategic planning; Perspective workshop; Q methodology-stakeholders selection; Reflexive interactive design; Resource flow map; Needs survey among CSOs; World café; World wide views.	Civic dialogue; Consensus conference; Future panel; Interviews; Knowledge atelier; Open space technology; Participatory strategic planning; Q methodology-stakeholder selection; Reflexive interactive design; World café; World wide views.	CIVISTI; Civic dialogue; Community- based (participatory) research; Consensus conference; Deep democracy - the Lewis method; Delphi method; Future panel; Group Delphi; Interviews; Knowledge atelier; Multi criteria decision analysis; Open space technology; Participatory strategic planning; Perspective workshop; Q methodology-stakeholder selection; Reflexive interactive design; Needs survey among CSOs; Science café; World café; World wide views.	Citizens hearing; CNISTI; Civic dialogue; Community-based (Participatory) research; Deep democracy-the Lewis method; Deliberative (Mini-publics) workshops; Focus groups; Interviews; Knowledge atelier; Multicriteria decision analysis (MCDA); Participatory budgeting; Participatory strategic planning; Perspective workshop; Science café; World café; World wide views.	Citizens hearing; Community-based (Participatory) research; Consensus conference; Deep democracy-the Lewis method; Focus groups; Interviews; Knowledge atelier; Multi criteria decision analysis (MCDA); Perspective workshop; World café; World wide views.	Consensus conference; Focus groups; Interviews; Open space technology; Reflexive interactive design; World café.	Consensus conference; Deep democracy-the Lewis method; Focus groups; Interviews; Participatory strategic planning; Perspective workshop; World café.	Consensus conference; Focus groups; Interviews; Knowledge atelier; World café.	Civic dialogue; Consensus conference; Delphi method; Future panel; Group Delphi; Interviews; Knowledge atelier; Multi criteria decision analysis; Open space technology; Participatory strategic planning; Perspective workshop; Reflexive interactive design; World café.
Project definition	Action research; Challenge prizes; Charrette; Civil dialogue; Community-based (Participatory) research; Delphi method; E-conference; Focus groups; Group Delphi; Interviews; Knowledge atelier; Open space technology; Participatory design; Participatory strategic planning; Q methodology-stakeholder selection; Reflexive interactive design; Science shop; From question of a CSO to a research question; Needs survey among CSOs; User committee; World café; World wide views.	Charrette; Civil dialogue; Deliberative online forum; E- conference; Interviews; Knowledge atelie; Open space technology; Participatory strategic planning; Q methodology- stakeholder selection; Reflexive interactive design; World café; World wide views.	Challenge prizes; Charrette; Civic dialogue; Community-based (participatory) research; Deep democracy - the Lewis method; Delphi method; E-conference; Group Delphi; Interviews; Knowledge atelier; Open space technology; Participatory sensing, volunteer sensing, citizen observatory; Participatory strategic planning; O methodology-stakeholder selection; Reflexive interactive design; Science shop; Needs survey among CSOs; Science café; User committee; World café; World wide views.	Action research; Challenge prizes; Charrette; Civic dialogue; Community-based (Participatory) research; Deep democracy- the Lewis method; Deliberative online forum; Democs card game; E-conference; Focus groups; Interviews; Knowledge atelier; Participatory design; Participatory sensing, volunteer sensing, citizen observatory; Participatory strategic planning; Resource flow map; Science café; World café; World wide views. In the following pages, you will find factsheets containing description of the engagement methods and tools. These descriptions contain information concerning the specificity of the individual method, e.g. the objectives of methods/tools application, results and products of methods' application, level of stakeholder involvement, engaged stakeholders, strengths and weaknesses and others. The descriptions presented are not comprehensive. More information can be found using the links provided in the section Sources.

The majority of the factsheets describe engagement methods; a few, however, describe tools used for engagement. A method is a well-defined process that is fit to perform a certain set of roles<sup>1</sup>. Often the method has a procedural form, making use of several tools in sequence. A tool is a technique (e.g. an interview), which potentially can be used in within methods, and which is less role-specific.

Besides the above listed four criteria, against which the methods/tools were mapped, the following two definitions related to the involved stakeholders will be useful in reading the factsheets:

- Direct participant is considered to be the stakeholder group which has been engaged in the process
- **Beneficiary** is the users of the results of the method.

<sup>&</sup>lt;sup>1</sup> Note that often, specific impacts can only be reached through use of a combination of methods.

Action research has been applied in several fields of practice including the workplace, education, public health, and development aid. The science shop concept (see the separate fact sheet) can be regarded as an example of action research in practice. In contrast to citizen science, it comprises not only the practical engagement of laypeople in research, but also aims at transformative action by involving people in the scientific exploration of their own living conditions and everyday problems, and those related to the environment, in order to induce a change in these conditions initiated by people themselves. It is a communicative process that is based on the acknowledgment of different equitable forms of knowledge (i.e. scientific knowledge as well as that of citizens).					
<ul> <li>Acting on the basis of the dec</li> <li>Observing the effects of actio</li> <li>Reflecting on these effects an</li> </ul> The different steps are performed joint	of the under-privileged. It emphasizes the practical purpose and origin of knowledge and directs research at the needs of people rather than framing it as merely a "ivory tower" academic pursuit. This implies that action research starts from a practical problem emanating from a community and explores this problem in a learning process that involves scientists as well as lay persons. It is undertaken in order to inform and empower action in terms of the community's ability to solve or adapt to problems at hand. The concept of action research starts from the notion that objective knowledge is impossible to have since the researcher is always part of the world he/she studies. Additionally, the research process cannot be ideologically neutral, but is always suffused with political undertones which are aimed at serving particular purposes (Reason & Bradbury, Handbook of Action Research 2001/2008).  One of the "fathers" of action research described the actual process of action research as a scientific approach to planned change (the practical, problem-oriented starting point of action research). This process is made up of a spiral of steps, each of which is "a circle of planning, action, and fact finding about the result of the action" (Lewin 1948, see Wikipedia article on "participatory action research"). In this process, researchers and laypeople are always involved and are engaged in a joint learning process. The process circles comprise the

Additional information of relevance (such as historical background, where the method has already been applied, etc.)

Action research is a particular approach to research which includes public engagement, rather than being a method of public engagement itself. The term 'action research' was coined by Kurt Lewin in the 1940's in the USA. Elements of action research, however, can also be found prior to this in the work of the American philosopher John Dewey ("learning by doing"). The approach of combining research with direct "emancipatory" intervention in the field of research is not only applied in community-based research (which is in the focus of this fact sheet) but also in organisational development, professional development, social psychology and in other fields.

Name of the engagement	2. Challenge Prizes					
method (alias)	(also called: 'inducement' prizes)					
- motirou (anas)						
Short description of the method	Challenge prizes offer a reward to whoever can first or most effectively meet a defined challenge. They act as an incentive for addressing a specific problem, rather than being a reward for past achievements. A challenge prize can incentivise innovation, focus attention on a particular issue and unlock financing and other resources.					
Long description of the method	Background Challenge Prizes have prompted a range of developments in science and technology across the world. Often they aim to solve big problems and, if successful, can produce major breakthroughs in human knowledge and practice.					
	Challenge Prizes are not always aimed at making radical leaps or achieving complex goals, they are also used t raise awareness or encourage investment in a neglected issue or problem. They can also encourage necollaborations and partnerships, gather new information or data, identify good ideas or excellent practices, an build capacity of new innovators.					
	Methods and Approaches  Challenge Prizes have made a comeback in recent years, with a renewed interest across the private, public and non-profit sectors. This increase is accompanied by experimentation and innovation in the types of methods and approaches to running challenge prizes. In particular, prizes are thriving in the context of collaboration and partnership building offered by the internet and social media. Using digital platforms, organisers can publicise challenges and reach out to communities on a global scale. Over the last decade there has been a proliferation of online solutions and market places designed to support people in proposing challenges and in receiving solutions. These include InnoCentive.com, Changemakers.com and Kaggle.com.					
	For governments and funders, challenge prizes can be used as part of a toolkit that includes other support mechanisms such as grants and loans.					
	Challenge prizes are based on a simple idea. The problem is identified, the challenge is publicised and the person with the best solution is awarded the prize. Challenge prizes can be structured as a pure prize, where the prize giver is not involved in the development of solutions, or as a grant/incubation hybrid where the prize giver offers support to drive up the quality of solutions.					
	Organisers need to find ways to incentivise individuals or teams to share the risks associated with an uncertain reward. They will also need to measure and judge performance and lay the groundwork for the uptake of solutions following the awarding of the prize. It is also important for them to understand why the challenge has not been met (if indeed it hasn't) and whether the right conditions can be created to address this.

Specific <b>strengths and weaknesses</b> of the method vis-à- vis the challenge(s) addressed	<ul> <li>Challenge prizes can help funders maximise value and manage risk because resources are allocated to competitors who deliver innovation.</li> <li>Challenge prizes stimulate and support new ideas and new people/groups to become active problem solvers.</li> <li>Setting up a prize often requires a significant amount of research in order to identify the right challenge. Failure to set a suitable end goal is likely to fundamentally undermine the effectiveness of the challenge.</li> <li>The competitive nature of challenge prizes may not be best suited to complex societal issues.</li> <li>Challenge prizes tend to be technology/product innovation focused rather than social innovation focused. Some recent challenges have focussed on complex social/environmental problems. For example, NESTA's The Big Green Challenge was designed to encourage a community led approached to climate change.</li> </ul>					
Timeframe for the application of the method	Challenge prizes are	likely to take around	a year to set up and cou	ld take several years to	complete.

What are the issues of concern that organisers need to take into account when applying the method?

- Stimulating enough attention around the challenge to encourage individuals or teams to carry the risks associated with working towards an uncertain reward.
- Understanding why a challenging issue has not been met is crucial since a prize may not resolve the deep systemic barriers to innovation.
- Narrowly defined challenges may risk excluding more unpredictable solutions. Therefore, the problem and solution must be defined appropriately or left open in a way that allows for unpredictable effective solutions to emerge.
- Crowdsourcing exercises to define 'challenges', rather than just crowdsourcing 'solutions', may lead to social innovations that are human focused rather than technology focused

Additional information of relevance (such as historical background, where the method has already been applied, etc.)

Challenge Prizes have a long history and have accelerated progress towards ambitious goals. The Longitudinal Prize offered in 1714 for a simple and practical method for the precise determination of a ship's longitude is one example. They have also created new markets and prompted the development of new industries. For example, when Charles Lindberg became the first pilot to fly non-stop from New York to Paris, winning the Orteig Prize in 1927, his celebrity transformed the aviation industry.

#### **Further information**

"The focus of this guide is the challenge prize, a tool for stimulating, supporting and testing innovation, particularly among new groups of people. We have found that our Big Green Challenge programme and 'Mass Localism' report, alongside recent developments in methods such as crowdsourcing and co-production, have struck a chord with funders and policymakers looking for new ways to generate ideas from community-based innovators".

#### 3. Charrette Name of the engagement (also called: Design Charrette, Enquiry by Design) method (alias) \*Similarities to Scenario Workshop Charrettes are used in urban planning to facilitate input from the community in a specific geographic area. They Short description of the method are intensive workshops for many stakeholders to work together, including policy-makers, experts and the general public. A key element is the integration of design activities in an early phase to make implementation plans and/or research proposals. Charrettes are used in urban planning to facilitate input from the community in a specific geographic area. They Long description of the method are intensive workshops for many stakeholders to work together, including policy-makers, experts and the general public. A key element is the integration of design activities in an early phase to make implementation plans and/or research proposals. Origins of the term "Charrette" The word Charrette is French for "cart" or "chariot". In the École des Beaux-Arts in Paris in the 19th century, it was not unusual for student architects to continue working furiously in teams at the end of the allotted term, up until a deadline, when a Charrette would be wheeled among the students to pick up their work for review while they, each working furiously to apply the finishing touches, were said to be working en Charrette, in the cart. [...] The term metamorphosed into the current design-related usage in conjunction with working right up until a deadline. At the core of the method is an event called the Charrette workshop which aims to have the right ingredients and environment to stimulate a creative process with stakeholders. Usually this takes place over a number of days. This needs extensive planning and preparation but also a thorough follow-up. There are many variations on this format and one of the defining elements is the number of participants<sup>3</sup>. Preparation phase The main workshop is prepared by a steering committee of 10 to 15 people. They decide on the focus of the Charrette and require input from stakeholders. This should be done both by involving a number of representatives of stakeholders in the committee, and by tapping into the networks the members have in the community. This will also facilitate the process of inviting a broad range of participants. The steering committee is also responsible for the gathering of information that feeds the Charrette workshop. This should be a wide range of data related to the specific area but can also include expert opinions and example projects from other areas. 2. The Charrette workshop There are examples of Charrette workshops with more than 1000 participants. Generally, the Charrette team consists of about 50 people and also includes an event open to the general public. The Charrette consists of a number of sessions and usually there are three types of sessions before the public session including: Getting to know each other and the core issues; It can be useful to do a site visit but the information that has been gathered beforehand to bring the participants up to speed is the key. ii. Gathering input from the participants' In-depth interviews in subgroups should be held to gain insight into the views of each stakeholder. Each participant also prioritises the issues that they raise. iii. Integration; Finally the collected information is integrated and analysed in preparation for the public meeting. This involves brainstorming and analysis to make some initial recommendations. The purpose of the public event is to check the direction of the Charrette team effort. They present their preliminary analysis and the overview of goals and objectives that has been gathered from the stakeholders. Based on the feedback, the focus can be adjusted if necessary. After the public event, the Charrette team has a number of sessions alternating between working in small

groups and working in a plenary setting. The groups are divided in order to work on one specific issue with at least one relevant expert in the team. They generate proposals for their specific issue and present them to the

<sup>&</sup>lt;sup>2</sup> "Charrette". Wikipedia, the Free Encyclopaedia, 13th July 2014. <a href="http://en.wikipedia.org/w/index.php?title=Charrette&oldid=595193961">http://en.wikipedia.org/w/index.php?title=Charrette&oldid=595193961</a>.

<sup>&</sup>lt;sup>3</sup> This description is mainly based on the *Participatory Methods Toolkit. A practitioner's manual,* which was published in 2006 by two Belgian foundations. http://www.kbs-frb.be/publication.aspx?id=294864&langtype=1033

whole group. The responses on their presentations are then used as feedback during the design process in the

	sub-group sessions.				
	3. The follow-up The Charrette generates many ideas and possible solutions. These need to be shared with the general public in a second open meeting. This phase includes the preparation of the event and presentation, but also a final document which needs to be readable for the general public.				
Objective of application of the method	Note: a Charrette d	can be seen as a desig also be seen as the		rticipants are actively e	activity   Others: engaged in the research participants are actively
Results and products of the method application	The process ends with a public presentation of a design. This is supported by documentation covering a summary of the process and the proposed projects, key findings and recommendations.  The intended outcome is to develop feasible implementation plans and/or focused research projects that are based on early participation of stakeholders in an urban planning process.  For example, the Charrette Rijnenburg in the province of Utrecht, Netherlands, had 4 themes <sup>4</sup> :  1. Physical infrastructure of a new district (5000-7000 homes); how to deal with soil, water and the landscape?  2. Society: how can we ensure that the inhabitants together form a sustainable and climate-change resilient society?  3. How to make sure the district functions in a sustainable way in relation to its surroundings?  4. How to ensure that the various elements (buildings, roads, etc.) are produced in a sustainable way that can cope with climate-change?  They led to implementation plans, e.g. in soil, water, and the landscape:  By creating natural boundary areas, (bio)diversity in soil, water and landscape is maximized.  The water system will be fit for multiple purposes.  The sharp border between city and polder landscape, marked by the high way, should be seamless.  New forms of agriculture will be developed on the many bodies of water in the area.  And they led to research questions, e.g. in soil, water, and the landscape:  Will the spatial planning be temporary or permanent?  How high do weirs and dikes need to be, to keep adjacent cities safe from peaks in water levels?  How much water can the area hold, and which measures does this require?  How large should a unit/village be to be self-supporting (energy and society)?  How to remove the visible barrier formed by the high way?

Name of the engagement method (alias)	4. Citizen compass (in German: Bürgerkompass)					
Short description of the method (max 300 characters)	The citizen compass is a format of participation where citizens (randomly selected) evaluate the work of the government using criteria they develop. On this basis the citizens propose measures for the future work of the government. The citizen compass offers a platform for politicians to learn what citizens think about political topics and what recommendations they would give for policy making.					
Long description of the method (min 1500 characters, max 3000			was developed by the Be s been only conduced on		·

	feedback to the citizens as well as the public. Suitable proposals will be integrated in their further political work.  However, the participatory process starts before the <i>preparation</i> of the main event: a smaller group, around 20 participants, chooses the topics which should be discussed at the main event as well as the information material. Here, it is necessary to narrow the scope of the topics which can be discussed (for the example of Saxony: topics had to be within the area of responsibility of regional politics. The topics chosen were: "Economy and social policy", "Education", "Infrastructure"). Thus, it is important to define the scope of influence as well as the general framework right at the beginning of the process to have a clear purpose and a basis for realistic expectation for the citizens.  Another crucial aspect is the <i>follow-up</i> of the participatory main event. In the case of Saxony, the state government evaluated the proposals. 	On the other hand, the method also has weaknesses, which should be kept in mind when thinking about applying the method. Thus the method should not be applied when:  There is a situation of conflict;  There is a solution needed for specific problems;  Specific expertise is desired.					
	In order to conduct the method successfully, the focus of the citizen compass should be clearly defined beforehand in order to address the right actors. If an open process is wanted, all actors who are interested in the topic should be invited. When the process aims at a specific topic, it should be conducted with very specific groups only.

What are the issues of concern that organisers need to take into account when applying the method?	The main issues of concern are how the results of the process are finally used and taken up by the government. There is a danger that expectations are raised by the broad integration of citizens which come to very specific proposals which cannot be addressed/ fulfilled in the subsequent political process.				
Examples of use of the method	Project name	Organisation	Contact persons	Timeframe	Web address
	Citizen Compass Saxony	Office of the governor of Saxony and the Bertelsmann Stiftung	Burkhard Beyer (Office of the governor of Saxony) Christina Tillmann (Bertelsmann Stiftung)	2,5 days for events, but several months for preparation and follow-up	http://www.ministe rpraesident.sachsen. de/buergerkompass. htm
Additional information of relevance (such as historical background, where the method has already been applied, etc.)	This method is rather a "new" method which was only applied once. Thus, so far the experiences with the method are limited to the case of Saxony. Here, it seemed that the process itself, which was initiated by the governor of Saxony (belonging to the Christian democrats) went well. However, in the aftermath of the citizen compass, there was a lot of debate (and critique) by the other parties - the social democrats and "die Linke" stated that the votes of the citizens and the outcomes of the participation process were not reflected in following political decisions.  Furthermore, there is no scientific analysis on this method so far.

Name of the engagement	5. Citizen Science						
method (alias)		*Field of Practice: Citizen Science cannot be regarded as being one method, but is rather a field of activities to engage lay people in scientific research in many ways (depending on the nature of the research project).					
Short description of the method	Citizen Science is the inclusion of lay persons in scientific research by asking questions and/or collecting or analysing data as part of a scientific project. Citizens are actively engaged in scientific work, so that scientific research is being done by the citizen and not just for the citizen. Nowadays Citizen Science is an organized, and in many cases hierarchical, process meaning that citizen science projects are mostly (not necessarily) initiated and supervised by professional scientists. Citizen Science projects are carried out for research that affords a great number of spatially dispersed contributions (such as for weather or environmental observations) or involves a great amount of tedious work that does not necessarily involve expert knowledge.						
Long description of the method	Internet-based communication allows scientists to easily connect big groups of people all over the world, and devices such as the smartphone make it possible to instantly report observations to scientific databases. Particular software (for mobile phones and PDAs) that supports monitoring and data collection is provided, which enables even non-literate communities to record animal observations as part of biodiversity research projects. Projects like "Polymath" (a successful joint approach to a mathematical problem organized by a world leading mathematician and involving professional and hobby mathematicians, students and school teachers all over the world), or "Galaxy Zoo" are often referred to as proving enormous potential of engaging the wisdom of the crowd for scientific problems.						
	"Galaxy Zoo" started at the University of Oxford in 2007 when a group of researchers planned to inspect 930,000 images of distant galaxies in order to understand the formation of galaxies. Since the researchers could not rely on computer scanning (the potential of computers for image identification is still quite restricted) they started to involve "the crowd" by setting up the internet platform "Galaxy Zoo" (the initiative was publicized by a blog on the BBC webpage). "Before the project started, the largest published study was based on 3000 galaxies. Seven months after the project was launched about 900.000 galaxies had been coded and multiple classifications of a given galaxy by different volunteers were used to reduce the incidence of incorrect coding, for a total of roughly 50 million classifications. For an individual scientist, 50 million classifications would have required more than 83 years of full-time effort." (Franzoni/Sauermann 2014: 5f.) The results have been made publicly available and have been referred to in more than 100 pertinent scientific papers. Moreover, a new, not known before, quasar like object had been spotted by a Dutch school teacher involved in the project.						
	Several follow up activities and new projects have been started by the University of Oxford team. Cooperation with other projects led to the setup of a joint platform for citizen science projects called Zooniverse (www.zooniverse.org) including projects form fields as diverse as astronomy, marine biology, climatology and medicine (Franzoni/Sauermann 2014). The ICT technologies involved in these and other new formats of internet based citizen science are manifold (websites, mobile phones, blogs, social media). One of the most interesting trends is the development of special computer games that allow a broad community of gamers to support research in a playful manner, such as Eyewire (http://blog.eyewire.org) or Fold.it (http://fold.it/portal/) which involve laypeople in mapping protein structures. As these projects show, online gaming is obviously a way of substantially managing mapping tasks, with lay people contributing to the research process creatively, and also by developing suggestions for improving the process. In some cases, these playful forms of engagement are						
Objective of application of the method			elopment $\ \square$ Project de		•		
Results and products of the method application	The product of a citizen science project usually does not differ from the product of a usual research project. Citizens provide data that are used in environmental monitoring or as input into computer models (e.g. of climate change) as well as interpretations of data (as in the galaxy zoo project on classifying images of galaxies). Most projects result in scientific reports and scientific journal articles.

Specific strengths and weaknesses of the method vis-à-vis the challenge(s) addressed	The strength of the method lays in the fast collection of great amounts of data, observations and/or ideas for problem solving. Besides this "functional" benefit for research, citizen science can help strengthen the ties between science and society and raise awareness on scientific work among the wider public. The direct involvement of citizens in research, which can help to make people learn about what research implies in terms of methods, skills and reasoning, is another strength of the method. The method does usually not imply the influence of laypeople on project design and is not tailored towards engaging people in problem definitions and setting research objectives (but it might be possible to include these as well in case of research done on socially					
Timeframe for the application of the method	defined problems).  The time frame of citizen science projects varies a lot. Projects can be done on single issues, such as categorising or sorting a given set of data, all the way up to long term monitoring projects (e.g. on biodiversity or environmental quality) with a time frame of several years. Preparation includes the design of research in a way that is understandable or manageable for laypeople, as well as finding a group of lay supporters of appropriate size.

					with lay people	
What are the issues of concern that organisers need to take into account when applying the method?	A main barrier or challenge is developing a connection between scientists and possibly interested volunteers. This is made easier nowadays by social media and by web platforms (such as <a href="www.scistarter.com">www.scistarter.com</a> ) which provide overviews of running projects and help to connect scientists with volunteers.  A main issue to be dealt with by organisers is ensuing the quality of research carried out and data provided by lay people. Research being done in that respect shows that it is not necessarily the case that citizen science would not match the standards of professional science. The quality of data and interpretations provided varies widely among individual laypeople but often is as good as research done by scientists. Some rely on the sheer amount of people involved thus levelling out outliers in data quality. In other projects, special measures for quality control by cross checking results are integrated. The proper structuring of problems and definition of subtasks are essential, as well as good quality training and instructions for lay people.

Additional information of relevance (such as historical background, where the method has already been applied, etc.)  Sources (names of interviewees,	Citizen science, as a modern phenomenon of involving lay persons in scientific inquiry, was first developed in weather observation and in the field of biology in projects about monitoring and reporting about the migration or distribution of species. The so called "Christmas Bird Count" in the United States dates back to 1900. Nowadays there are schemes of ornithology societies and institutes for cooperating with lay birdwatchers in many countries. Many collections of specimens in natural science museums, as well as data sets about annual bird migration, weather, flowering periods of plants dating back hundred years, have been assembled by large groups of amateur scientists, and now form a basis for research about climate change or biodiversity. In the last couple of years, citizen science has seen an enormous development in terms of research fields covered and number of people and organisations involved. The use of modern communication technology and especially internet- based collaboration can be regarded as the main factor providing new momentum for citizen science.  The concept has been taken up by research and funding institutions of the scientific mainstream. It is very useful for scientists when they need to analyse huge amounts of data, or collect large volumes of field data over a wide (sometimes global) geographical area and - in terms of budget and time – is often the only option to collaborate with large groups of volunteers. Citizen science is sepecially attractive for ecological science when observing climate change, invasive species, conservation biology, environmental quality monitoring (water, air), population monitoring and other areas. Besides the functionality of involving lay people in research projects, there are other benefits regularly mentioned in pertinent literature, such as its positive effects on learning, and improving public understanding of science as well as on raising awareness of scientific working methods among the public. In general, Citizen Science is held to contribute to w

Name of the engagement method (alias)	6. Citizen juries (also called: Planning cells; in German: Plannungszelle)				
Short description of the method	public policies. Wit revealed and a con	hin a jury, the opinion nmon decision of the ical problem can be s	consult a governmental body on a problem which is relevant for current inions and perspectives of citizens, who are all policy stakeholders, are he participants is made. Against this background, citizen juries are most be solved in a number of ways. This jury then explores one or several of		
Long description of the method	The method is predominantly applied on the local or regional government level. Normally, an administrative body contracts an independent organization to facilitate and supervise this participation process. The organization randomly selects 12-25 citizens who should find solutions for the pre-defined problem. Sometimes participants receive an honorarium or some form of financial compensation for their time.				
	The relevant people should be those who might be affected by the potential decision. Typical demographic variables (age, education, gender, geographic location and race) should be representative. A further criterion might be reasonable if it can be related to the issue at stake. To recruit the jurors, it is best to randomly send a survey to the relevant people. Depending on the answers, the jurors can be selected.				
	A jury shares similar principles as a legal jury. Citizens come together and are confronted with a problem that they should work on. Similar to the legal model, the jury calls for experts which are named witnesses. Either the experts are selected by the responsible organization or by the citizens themselves. After hearing the experts, the citizens work together in small groups on different parts of the problem. They come to a decision and several recommendations are written down in a report. The report must be presented to the governmental body who contracted the jury, and the members of the body are expected to formally respond to the results presented.				
	The citizens turn into informed decision makers during the procedure. Usually, not only one jury or planning cell, but several, are organized so that the contracting body gains a clear picture of what kind of possibilities, opportunities and threats are foreseen. In addition, normally one political option is favored by participating citizens. Thus, the more planning cells they are organized, the less probable it is that individual ideological tendencies dominate the overall outcomes.				
	Normally, the organization process is accompanied by an advisory board which either consists of experts field or of stakeholders. The selection of board members might depend on the degree of the conflict be the stakeholders. If tensions are high, then the advisory board might not be able to make any clear state Furthermore, extra working groups consisting of members of the sponsor and members of the a committee might ensure that the jury will fulfill all expectations. There should also be facilitators who are of the method in detail.				
Objective of application of the method	■ Policy formulation □ Programme development □ Project definition □ Research activity □ Others:				
Results and products of the method application	Lots of experiences can be observed in health policy-decision making. A literature study from Jackie Street et al. reviews articles describing a total of 66 citizen juries in this field, covering ethical topics, questions of priority-setting and resource allocation, health policy issues like mammography screening, telemedicine or health system reform, environmental health issues like nanotechnology or GM foods, and community wellbeing (Street et al. 2014).  In the European Water Framework Directive further regulation on the application of participation is included (Bos-Gorter et al. 2006). Between 2003 and 2006 several citizen juries were organized, and one of them was funded by the EU Commission "as an experiment to assess the usefulness of the method in the drafting of water-basin-management plans" (Huitema et al. 2010). In all cases, politicians or representatives of the administration discussed the recommendations at the end. The consent the jurors aimed at was problematized by the politicians "in order to be able to emphasize those aspects in the jury recommendations that would fit their political point of view" (Bos-Gorter et al. 2006). In interviews the political representatives stated that they could make little use out of the recommendations (Huitema et al. 2010).

The observation I especially to foresee e not able to develop ises. It is rather difficult
	Mostly, the participating citizens learn a lot. Compared to that, it is rather a matter of hope that political representatives attending an event at the end of a jury process can claim the same benefit. Only three studies of 66 citizen juries indicate that a governmental body would consider the recommendations (Street et al. 2014). However, it should be the minimal requirement that decision makers show up and discuss the results. However, this final element of citizen juries is rarely observable.					nefit. Only three studies ons (Street et al. 2014).
	A citizen jury or a planning cell should be organized according to given standards, e.g. facilitators should be motivated and skilled, the process should be transparent and open, all interests should be represented and voiced, and enough resources should be available to compensate the participants (Bos-Gorter et al. 2006; Huitema et al. 2010).					ıld be represented and
	Another weakness is that a citizen jury may not feed into a policy making process. It is crucial that organisers are clear with participating citizens at the outset regarding intended and realistic outcomes.					ucial that organisers are

Additional information of relevance (such as historical background, where the method has already been applied, etc.)

The planning cell, citizen juries or consultative approaches such as hearings, have become popular methods. The Aarhus convention of 1998, which entered into force in 2001, marked a watershed event for participation (http://www.unece.org/fileadmin/DAM/env/pp/documents/cep43e.pdf). It is an international treaty with a geographical focus on Europe, which gives citizens and the civil society several rights. Public authorities are obliged to provide everybody access to environmental information. Moreover, "[a]rrangements are to be made by public authorities to enable the public and environmental non-governmental organisations to comment on, for example, proposals for projects affecting the environment, or plans and programmes relating to the environment, these comments to be taken into due account in decision-making, and information to be provided on the final decisions and the reasons for it" *European Commission*, 2014a: The Aarhus Convention. Brussels; http://ec.europa.eu/environment/aarhus/ (downloaded 6.3.2014). If decisions are made without respecting the rights of free availability, of information or participation, then these decisions can be reviewed by judges (Keupp, Zschiesche 2010).

Name of the engagement method (alias)	8. Citizens' Assembly
Short description of the method	A citizens' assembly is a body of citizens brought together to deliberate on an issue or issues of local, regional or national importance. The purpose is to employ a representative selection of the public who can learn about a topic, assess options and make recommendations without any influence from policy makers and politicians.
Long description of the method	A citizens' assembly usually has four phases: a selection phase; a learning phase; a public hearings or consultation phase; and a deliberation phase. It often produces a report with recommendations which is later presented to relevant policy makers or put to citizens in the form of a referendum.
	Citizens' assemblies usually need a chair and a secretariat to organise the process. Both are usually appointed by the authority setting up the assembly. They must be independent of the commissioning authority. The method can be quite resource intensive.
	The timing of each phase depends on a number of factors, for example, the topic, how many opportunities there are for citizens outside the assembly to participate, and how much time participants are expected to invest in the process. Processes often take around one year to complete with selection being quite often the longest phase.
	Citizens' assemblies can involve hundreds of people. However, in most cases membership ranges from 100 to 160 participants. It can be more difficult to ensure broad and equal representation among participants in larger assemblies.
	Citizens' assemblies usually attempt to create a mini-public that is representative of a wider population. This is sometimes achieved through random selection from the electoral register. Members are then selected from a pool of respondents through stratified sampling based on various demographics such as gender, age, ethnic group etc. Special efforts are often made to ensure that usually marginalised groups are not excluded.
	A central part of a citizens' assembly process is the learning phase. Participants are often provided with learning materials that introduce them to the topic being discussed before the assembly starts. This is followed by a series of workshops designed and conducted by engagement specialists. Here participants are likely to hear from 'experts' related to the topic including academics, stakeholders and policy makers. Participants are expected to deliberate and develop their own ideas throughout this process. Sometimes the wider public is engaged online where resources are published and debates can take place on online forums, and through consultations and public meetings. Insights from these wider conversations can be fed back into the assembly process. Assembly meetings are increasingly being broadcast on the internet.
	The deliberation phase of the assembly involves members coming to some conclusions on what they have learnt through the assembly process. Most large assemblies will do this through voting systems, but smaller assemblies might use consensus conference decision making (a method first used by the Danish Board of Technology which highlights both areas of agreement and disagreement amongst groups).
	The outcomes of the assembly are often presented to the commissioning authority or other public policy making body for consideration and response. The nature of this response will depend on the purpose and scope of the Assembly.
Objective of application of the method	☑ Policy formulation □ Programme development □ Project definition □ Research activity □ Others:
Results and products of the method application	What is achieved and produced will very much depend on the scope or remit of the citizens' assembly. This can be outlined in a memorandum of agreement between commissioners, policy makers and the citizens' assembly members prior to the assembly commencing. Usually, members of a citizens' assembly will produce a formal report on findings or a set of recommendations.  In two relatively unusual cases (British Columbia Citizens Assembly and Ontario Citizens Assembly), both on electoral reform, the process led directly to a referendum where the public was able to vote on whether to change the way politicians are elected. In both cases the public voted against electoral reform.
Level of stakeholder/public involvement, i.e. objective of public participation through the method's application	☑ Dialogue ☐ Consulting ☑ Involving ☑ Collaborating ☑ Empowering ☑ Direct decision

Specific strengths and weaknesses of the method vis-à-vis the challenge(s) addressed	Strengths:  Can bring diverse perspectives on complex problems (Health, Food security, Energy, Climate Change); High profile and often linked closely to policy making processes; Learning phase can change participant's perspectives /or behaviour; Building support for controversial issues, i.e., renewable energy; Increased transparency in policy-making might increase trust in policy makers; Increasing skills and knowledge of participants.  Weaknesses: Very intensive and resource demanding processes; Sometimes assemblies do not lead to significant outcomes; Some assemblies can appear as tokenism or "participation-wash", whereby citizens have no real say and the event is more about gaining good publicity or a citizen engagement box ticking exercise; Usually one off engagement; Can be expensive.					
Timeframe for the application of the method	Organising a citizen's assembly is likely to take more than a year. Recruitment often takes the longest. The citizens' assembly itself could take place over a number of months or could be repeated over a longer period.

The citizens receive information material before the hearing and are further introduced to the topic by experts at the beginning of the hearing. After the introduction, the citizens are divided into four workshop groups with 4-6 citizens at each group.  The groups brainstorm on the challenges perceived by each of them. The groups determine which 6-8 challenges they assess as most important. Each group appoints a chairman and the chairmen from the four groups meet to decide on 6-12 challenges for further discussion. The selected challenges are presented in plenum, assigned points by the citizens and one challenge is selected for each group.  In the afternoon, the participants work on their selected challenges. Each group has to recommend possible solutions and proposed courses of action for their respective challenge.  Finally, the challenges are once more presented in plenum for the participants, policy makers and media, accompanied by the suggested solutions and courses of action. Following this presentation, the participants assign points to the challenges and courses of action.  Objective of applica		the citizen catalogue of ideas. The project management publishes the catalogue with the ideas of the citizens, which are divided into topics, but otherwise uninterpreted. The Citizens Hearing produces ideas based on dialogues between citizens – it does not provide recommendations or priorities for the policy makers. The catalogue of ideas is sent to relevant politicians in municipal government as well as the Parliament and the press, and is published online.

#### **Indirect results**

A citizens hearing can help to bring citizens and politicians closer together, promote democracy for the citizens and provide politicians with a better understanding of what is important to people.

By getting the citizens' views, the politicians can increase their confidence when making deliberate changes with support from the public. It opens for more transparency in the decision making process and more sustainable solutions.

Name of the engagement method (alias)	10. Citizen Visions	on Science, Technolog	y and Innovation (CIVIST	Π)				
Short description of the method (max 300 characters)	and innovation age development. The	The CIVISTI method is based upon the idea that the process of defining relevant and forward-looking research and innovation agendas could, in many respects, be improved by including consultations with citizens in their development. The method uses citizens' concerns about societal development as a stepping stone for developing priorities in research programmes.						
Long description of the method	and identifies socie world, but rather a	etal demands for futu asks citizens what a o	ntifying forward looking re developments. CIVIST desired future would loo ng a desirable future on	I does not aim to deve ok like. Applying the C	elop models of the real CIVISTI method enables			
	Generally, the process starts with a group of 25 citizens, chosen on the basis of a standardised methodology. These citizens produce ten visions with a time horizon of 30-40 years, within the framework of a two-day workshop. On the basis of the values, hopes and fears that are incorporated into the visions, multidisciplinary teams of experts and stakeholders formulate recommendations for different addressees and on different time scales (i.e. R&D policy, technology developers, city planners or administrators). These results are then presented to all participants of the process for validation and prioritisation, in order to ensure the internal legitimacy and loyalty to the initial ten visions.							
	Third, experts and	stakeholders extract	citizens develop visions. S recommendations from ecifically, these stages in	these visions. Finally	·			
	a) Consulting national citizen panels through an informed deliberation process, focussing on long term visions, needs and concerns of citizens;							
	b) Developing criteria for the transformation of the visions into relevant areas for future science, technology and innovation activities;							
	c) Using the criteria, through stakeholder and expert participation processes, to analyse the citizen visions and transform them into possible priorities for research programmes;							
	d) Validating and supplementing the priorities through a second round of citizen consultations.

Specific <b>strengths and weaknesses</b> of the method vis-à- vis the challenge(s) addressed	The method disting of this is that the ex however, is that the politically possible a	It is an intensive method, requiring many human and financial resources and significant preparation.  The method distinguishes itself from other methods by separating citizens and scientific experts. The advantage of this is that the experts' agendas do not frame or influence the discussions of the citizens. A disadvantage, however, is that the citizens cannot adjust their visons to the context of what is technically, financially, or politically possible at present.						
Timeframe for the application of the method	In the original CIVISTI project the timeframe was:  Month 1: Framing of subject, definitions, delimitation.  Month 1: Training of facilitators of citizens consultations.  Month 3-6: Information/prompting of citizens.  Month 8-9: First round of citizen consultations.  Month 18: Expert/stakeholder workshop.  Month 26: Second round of citizen consultations.  Month 29: Policy workshop.  The CIVISTI timeframe has been scaled down in the EU project Public Participation in Developing a Common Framework for Assessment and Management of Sustainable Innovation (CASI):  Month 1: Framing of subject, definitions, delineation.  Month 5: Training of facilitators of citizens consultations.  Month 6-7: Information/prompting of citizens.  Month 10: Expert/stakeholder workshop.  Month 14: Second round of citizen consultations.  After: Report + Policy workshop.

What are the issues of concern that organisers need to take into account when applying the method?

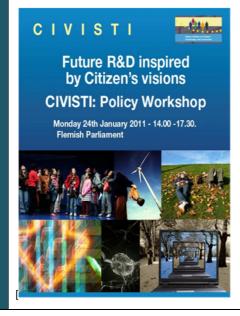

An important issue of concern when running a full scale CIVISTI process is that it can be difficult to retain the same group of citizens between the first consultation and the second one. It takes the organiser a lot of effort to prevent this.

Additional information of relevance (such as historical background, where the method has already been applied, etc.)

The CIVISTI method was developed as a part of a European research foresight project funded by the Socio-economic, Sciences and Humanities (SSH) portion of the Seventh Framework Programme. The aim of the CIVISTI project was to identify new, emerging topics for EU research and development policy. This happened through the consultation of citizens in 7 European countries.

Name of the engagement method (alias)	11. Civic dialogue
Short description of the method	Civic dialogue is a structured format for public dialogue that creates understanding among diverse people. It can build broad-based consensus and commitment around complex and/or controversial issues. Civic dialogue can be used in multiple contexts to help people communicate in a productive way.
Long description of the method	Description
	Civic dialogue cannot be regarded as one method; it is rather a range of associated methods used to engage people in complex and controversial issues.
	Civic dialogues are public conversations on a particular topic of societal relevance. The aim is to encourage individuals to try to better understand each other's positions on a particular topic and, thus, creating mutual understanding is at its core. The major purpose of civic dialogues is encouraging innovation, trust and confidence to facilitate the creation of a legitimate roadmap for moving forward in a particular direction.
	It is believed that civic dialogues can achieve fundamental, deep and broad changes as they are built around education and understanding. They use techniques that allow for mitigating conflict opinions and which address controversial topics in a productive way.
	The participants are different members of society. Diversity of the group is important; diversity of opinions and knowledge is welcome. In most cases, professional facilitators are used to help design, manage and evaluate the process.
	Common Models of Civic Dialogue
	Civic dialogue can take many forms. Dialogues vary in size, in organizers, in techniques used and in the emphasis on producing outputs.

The main types of civic dialogue are:

#### Type 1: Public inquiries

agreed outcomes.

Policy-makers can achieve more thoughtful opinions through initiating inquiries and commissions which gather public opinion on challenging or controversial topics, using civic dialogue. The events are usually open to all who wish to attend.

Dialogue is mainly conducted through workshops and similar meetings. The minimum aim is to find a mutually acceptable compromise, but ideally the process seeks to build on common ground and reach a proactive consensus. Every dialogue process is tailor-made to suit the situation, the people involved and to deliver the

#### Type 2: Open public conversations

The open public conversation can be initiated by any kind of entity - government, business, NGOs, academia or private citizens. The events are usually open to most who want to attend. Public conversations can accommodate a multitude of participants, depending on the objectives of the event.

#### Type 3: Selective participation

Some civic dialogues choose participants based on certain characteristics. Yet, in order to include a representative sample of the society in the civic dialogue, relevant expertise might be needed.

## 12. Community-Based (Participatory) Research (CB(P)R). Name of the engagement \*CBR has similarities to Science Shops (Civil Society Driven Research). CBPR has similarities to Participatory method (alias) Action Research. The community is involved in all stages of the research process, from setting the questions, to framing and doing Short description of the method the research, interpreting the results and communication. Research is focused on better understanding and then improving a certain situation. If combined with actions to implement findings, this leads to a cycle of participatory action research. Community-based participatory research is a "collaborative approach to research that equitably involves all Long description of the method partners in the research process and recognizes the unique strengths that each brings. CBPR begins with a research topic of importance to the community, has the aim of combining knowledge with action and achieving social change to improve health outcomes and eliminate health disparities." WK Kellogg Foundation Community Health Scholars Program CBPR is a collaborative research approach that is designed to ensure and establish structures for participation by communities affected by the issue being studied, representatives of organisations, and researchers in all aspects of the research process to improve health and well-being through taking action, including social change. CBPR involves: Co-learning and reciprocal transfer of expertise by all research partners with particular emphasis on the issues being studied with CBPR methods; Shared decision-making power; and mutual ownership of the processes and products of the research enterprise (http://accelerate.ucsf.edu/files/CE/manual for researchers agencies.pdf) The community is thus involved in all stages of the research process, from setting the questions, to framing and doing the research, to interpreting the results and communication. Research is focused on better understanding and then improving a certain situation. If combined with actions to implement findings, this leads to a cycle of participatory action research. A "community" can be a community of place and/or a community based on a shared issue or interest. What exactly constitutes the "community" is often self-defined, and not always codified in a legal status as, e.g., a formal association. In the descriptions of this approach it is good to realise that 'community' is the North American term for what in European English would be called civil or civic society. This method combines elements of Science Shops (Civil Society Driven Research) and Participatory Action Research, and Citizen Science as well. Projects can be part of larger themes of continuous attention (i.e. programmes). Students and research institutes can also be part of the research groups. Community-researchers can be trained as well. The element of 'learning' is integrated throughout, for all involved. The facilitating centres are either a separate entity (NGO) or, in some cases, part of a university. To start the contact with a community organisation (or civil society organisation in European English), see the Fact Sheets for Science Shops / Civil Society Driven Research (Method, and accompanying Tools). For performing the research, see Fact Sheet on Participatory Action Research. Methods from the Citizen Science group of methods and tools could also be useful. A useful guide is given by University of California in San Francisco: http://accelerate.ucsf.edu/files/CE/manual for researchers agencies.pdf Objective of application of the ☐ Policy formulation ☑ Programme development ☑ Project definition ☑ Research activity ☐ Others: method New knowledge is co-created that can improve the situation of communities. Results and products of the The US National Institutes of Health give the following advantages of community-based participatory research: method application Joining partners with diverse expertise to address complex public health problems; Improving intervention design and implementation by facilitating participant recruitment and retention: Increasing the quality and validity of research; Enhancing the relevance and use of data; Increasing trust and bridging cultural gaps between partners;

Providing resources for the communities involved;

# Name of the engagement method (alias)

#### 13. Consensus Conference

#### Short description of the method

The purpose of the consensus conference is to enrich and expand a debate on a socially controversial topic. A group of citizens rather than experts and politicians get together and set the agenda and the basis for assessment within a problem area.

#### Long description of the method

A group of 10-30 citizens give their views on a specific technological problem or a problem area. They debate, consult experts and formulate recommendations during a 3-4 daylong conference.

The citizen panel consists of 10-30 people selected randomly from the population. They meet in two weekends prior to the conference to broaden their knowledge on the topic from experts and documentation. The panel formulates a set of key questions they present to a panel of experts and citizens at the conference. During the first two days the experts present different views and citizen cross-examination of the questions. Then the citizen panel composes a report based on what they have learnt. On the last day they present the recommendations to experts, policy makers, stakeholders, the public and the media in hopes of broadening the debate on the subject.

#### Persons involved in the consensus conference:

- Project management (director, assistant and clerical staff)
- Advisory/steering committee (5-6 persons)
- Citizen panel (10-30 persons)
- Expert panel (approximately 20 persons)
- Facilitator

#### Project management:

The project management are in charge of the process and contract to different partners, recruit citizens and experts, and manage communications and the budget. They also assist the citizen panel in disseminating the recommendations and document the conference.

#### Advisory/Steering committee:

The advisory committee consists of stakeholders such as regulators, policy makers, scientists, industry and non-governmental agencies. They are selected for their knowledge, expertise and different views. They are responsible for securing a democratic approach while the process is transparent and fair.

#### The citizen panel

The citizen panel plays the leading role and consists of 10-30 people. The panel is composed of participants with varied backgrounds regarding age, gender, education, occupation and geographical location. They are non-experts but are expected to ask critical questions to the information presented to them.

#### The expert panel

The expert panel is selected to ensure professional and different aspects and views to the discussions at the conference.

#### **Facilitator**

The facilitator has to manage the dialogue and processes and have experience with participatory and consensus-based processes.

#### The consensus conference process

Day one: The experts present their answers to the questions from the citizen panel.

Second day: Clarification of the questions and time for discussion with the expert panel, the citizen panel and the audience.

Second and third day: The citizen panel produces the final document.

Forth day: The citizen panel presents their conclusions and recommendations to the experts and the audience, including the press. The experts can correct misunderstandings and factual errors, but are no longer allowed to influence the views of the citizen panel. The final document is a result of the consensus reached by the citizen panel.

#### Aims

The consensus conference aims to give citizens a meaningful opportunity to influence on policy decisions and assessing issues relevant for society. It has also been used for social experiments, research projects and as a means for promoting social awareness and public debate.

	A good conference topic is: of current interest; requires expert knowledge, which is also available; is possible to delimit; and involves conflicts and unresolved issues regarding attitudes to questions such as applications and regulation.						
Objective of application of the method	☑ Policy formulation ☑ Programme development ☐ Project definition ☑ Research activity ☐ Others:						
Results and products of the method application	Direct results						
	are summarised an	d presented in	n the fin		ensus reached during the d, and sent to all confere	•	
	Indirect results						
	The recommendations from the consensus conference provide a clear and important input to the debate on the topic and create a new understanding. The results give decision makers a rich source of socially relevant evidence/knowledge on a specific topic which can feed into decision making to create policies/projects which resonate with societal needs and are therefore more legitimate and sustainable. Such engagement activities, if carried out in early stages of policy/programme development, may also reduce controversy around contentious science and technology developments.

# Specific strengths and weaknesses of the method vis-àvis the challenge(s) addressed

#### Strengths

The consensus conference gives an opportunity to hear citizen voices — a large group of society who are usually not asked about their view on a specific problem. The inclusion can reduce democratic deficit of the citizens and give them ownership of the process and a sense of living in a successful democracy as they act advisors to the politicians.

The consensus reached by the citizens' panel contributes to politicians, experts and society as a whole on the ideas and concerns of ordinary citizens.

As it often is experts and policy makers who sets the agenda, the consensus conference allows for ordinary citizens to have a say and influence the debate.

The voice of the citizens reflects views and concerns that politicians don't necessarily see.

The citizens' panel make recommendations with awareness and knowledge and this can influence the policy making process in a new way. This opens for a more comprehensive decision-making.

The consensus conference is well suited for a new topic early in the development process to frame the debate. It can help shape a problem area that is not yet widely discussed by different parties especially at the political level. It is also suitable for topics in need of new inputs, development or a new agenda.

#### Weaknesses

The recommendations can't be used if the development or application of the technology or problem is not an object of political decision making. The consensus conference is most suited to topics which do not have a clear policy option.

The media may focus on the disagreements rather than the agreements.

The eternal criticism: Can the recommendations formed by 10-30 citizens be regarded as the general opinions of the entire population? Using random stratified sampling can create a group that is demographically representative of a population. The results of the consensus conference will not be the only form of evidence that decision makers use.

The consensus conference does not match a problem area that is too far in the development process.

# Timeframe for the application of the method

The process requires 12 months of preparation. (the process has been completed in 7 months but 12 is preferable)

- 1. Month: Recruit the advisory/steering committee. Setting the context for the conference. Contacting potentially funding resources.
- 6. 8. Month: Recruit and select the citizens' panel. Information material is being produced.
- 9. Month: Send information to the citizens' panel.
- 10. Month: The first study week is held. Citizens' panel is introduced to the topic, they identify key issues and question.
- 11. Month: Further education on the topic, finalisation of the key questions, finalising the selection of experts for the conference and planning the conference agenda.
- 12. Month: The consensus conference weekend: The public event normally covers three to four days.
- 13. Month: The final report disseminated to policy makers, industry, nongovernmental organisations and other interested groups and individuals.
- 14. 20. Month: The evaluation is conducted

#### Skills required in order to properly apply the method

Skills	No such skills required	Basic	Intermediate	Advanced
Subject-matter expertise			Х	
IT skills		x		
Facilitation skills				Х
Event organisation skills				Х

	Project management ski	ills			Х		
What are the issues of concern that organisers need to take into account when applying the method?	Making contact and collaborating with decision makers early in the process is important to ensure success.  The procedure of the consensus conference is expensive.  Recruiting a representative group of participants will increase the legitimacy of the process.

Name of the engagement method (alias)	14. Crowd Wise *similar to Consensus Voting						
Short description of the method	Crowd Wise is a community participation method, which aims to encourage consensus-based decisions. Consensus emerges in stages through a combination of discussion and voting on a set of previously formed options. The number of citizens participating can vary greatly depending on the specific objectives of the organisers.						
Long description of the method	Crowd Wise is a participative method, which aims to encourage consensus-based decisions in a variety of context, for example: setting policy priorities, allocating organisational budgets, and consulting. Its outcomes are more likely to be supported by participants, as consensus emerges in stages through a combination of discussion and voting on a set of previously formed options.						
	be open and it sho	ould suggest the need	the method is coming up to make options. Findir Illy one speaker presents	ng relevant speakers is			
	<ol> <li>Developing a r be developed</li> </ol>	by the participants, or	e question which reflect	but adapted in a way t	cipants. The options can o reflect the values and the speaker presents one		
	<ol> <li>Discussion: Participants are divided into small groups. Discussions aim to adapt the options in order to stir consensus. Sometimes original options are merged to formulate new option. The role of the speakers is not to stay on the panel and respond to the answers of the participants but rather to engage with them and help them improve the options. Before discussing how the original options can be adapted, however, a session can be added to the program in which small groups discuss each option separately (one group discusses one option). Presentations follow with each group presenting in the plenary the option they discussed. This is done in order for participants to better understand the presented options. Then, discussions follow on how the options can be adapted. This stage of the method can vary in time, but typically lasts between 50 min and 1h and 30 min;</li> <li>Voting on the options through 'consensus voting'/'preference voting'. Participants are invited to rank the adapted options in order of preference giving greater number of points to options they prefer;</li> <li>Counting votes: Everyone's full set of preferences (points given to each option) is taken into account in the tallying. The higher the number of points earned by the top option, the greater the degree of consensus. The chosen option is often a composite of some or all of the original options.</li> <li>A major goal of the method is to help participants find common ground, thus reduce polarisation of opinions in the group. There is no voting against options. Participants vote for all options, assigning different number of points to each option. Participants are, thus, incentivized to engage with the other participants, to understand</li> </ol>						
	how they can make their preferred option more appealing to the others.  Different numbers of participants ranging from 15 to 1500 can take part in the method, depending on the specific objectives of the initiative.						
Objective of application of the method	☑ Policy formulation ☐ Programme development ☐ Project definition ☒ Research activity ☐ Others:						
Results and products of the method application	The method can be used in variety of contexts, for example urban planning, policy development, and organisational development. Thus, the results vary according to the specific objectives and the context of the method's application. Yet, the major result of the method is moving closer to or reaching consensus on a certain question and developing options/solutions that work for most of the participants.						
Level of stakeholder/public involvement, i.e. objective of public participation through the method's application	☑ Dialogue ☑ Consulting ☐ Involving ☐ Collaborating ☐ Empowering ☐ Direct decision

	I						
Name of the engagement method (alias)	15. Science week (in Danish: Dansk Naturvidenskabsfestival)						
Short description of the method	Danish Science Week is a method to communicate science to a wide target audience. The purpose of the method is to create enthusiasm for science, technology and health among children and the youth, and to strengthen and develop interest in the science curricula in primary, secondary and upper secondary schools.						
Long description of the method	Danish Science Week is an annual event. However, it can also be viewed as an approach consisting of many methods which aim at communicating science to students in primary, secondary and upper secondary schools. Every year, the event has a new theme, and more than 100.000 children and youth take part in the activities.  The project organisation Danish Science Factory is responsible for Danish Science Week. Its secretariat produces a catalogue of ideas which comprises a number of different activities that the participating schools can carry out. The secretariat coordinates these activities, and sees to it that the event is introduced to schools and the press. The activities are developed in collaboration with many different stakeholders, for instance universities and companies.						
	the event at their	local schools and appl	ne setting for the activitie ly the methods with the w many of the proposed	ir pupils. There is no a	attendance fee, and the		
	One of Danish Science Week's Methods: "Mass Experiment"  One of the methods applied during Danish Science Week is the "Mass Experiment". The purpose of experiment is to give children and youths insights into scientific methods through the medium of an issue w relates to their everyday lives. Every year, the Danish Science Factory develops a new experiment collaboration with one or more research institutions. Around 1000 school classes - or between 20,000 30,000 children and youth - take part in the experiment. The pupils conduct experiments and collect data, afterwards, they report their results to Danish Science Factory and the scientists who analyse the data and was final report (for more on results, see below).						
	Besides the "Mass Experiment", Danish Science Week offers a number of different methods which communicate science. For instance, one of these is, "Book a Lecture" where scientists visit schools and share their experiences with science. During Science Week, between 500 and600 lectures are given. Furthermore, many external partners organise activities, so Science Week does not only take place in the classroom.						
Objective of application of the method	☐ Policy formulation ☐ Programme development ☐ Project definition ☒ Research activity ☒ Others: Supports and inspires education						
Results and products of the method application	As mentioned above, Danish Science Week reaches more than 100,000 children and youth throughout the country every year. One third of Danish primary and secondary schools participate, whereas two thirds of Danish upper secondary schools take part in the event. Moreover, external partners such as libraries, museums and companies are involved on an extensive scale. Even though the result isn't directly measurable, this considerable interest indicates that Danish Science Week lives up to its purpose. In 2013, Mikkel Bohm, director of Danish Science Factory, received the award "H.C. Ørsted Prisen". This award is given to a person who has contributed to making science accessible for the general public.  When it comes to direct results, it is worth mentioning the "Mass Experiment" as a citizen science initiative to collaborate in collecting data. In 2009, the experiment was about the indoor climate in Danish schools. The						
	results showed that more than half of the classrooms had a CO2-level that didn't live up to the recommendations of the Danish Health and Medicines Authority. In 2014, the schools that participated in the experiment will test if the indoor climate in Danish schools has improved since 2009. All in all, the "Mass Experiment" generates new and relevant knowledge.

Specific <b>strengths and weaknesses</b> of the method vis-à- vis the challenge(s) addressed	Strengths:  - The method reaches a large audience.  - The partnerships with universities, companies, etc. provide an opportunity for children and young people to realise how science is used in real life. The method contributes to building bridges between schools and society.  - The method is really flexible. The secretariat leaves it to the schools to decide how, and to what extent, they want to participate in the event.  Weaknesses:  - Danish Science Week isn't in control of the direct application of the method(s). It is up to the local teachers and schools to make their Science Week a success.  - It can be difficult to measure direct results of the application of the method.						
Timeframe for the application of the method	The theme is planne	ed three years	ahead. I	t takes place on the san	ne week every year.

Name of the engagement method (alias)	16. Deep Democracy - The Lewis Method						
Short description of the method	Deep Democracy is an advanced group facilitation method used primarily to access and bring out the wisdom already within a group, and particularly to release the creative potential that results from conflict. The focus is on inviting and spreading dissenting voices and encouraging exploration of places where groups or individuals are emotionally stuck. Thus, the method is particularly useful in 'conflict resolution'.						
Long description of the method	The Deep Democracy method is designed to bring out underlying emotions which prevent a group of people from moving forward. The method focuses on roles and relationships rather than on individuals. A role in this sense means what is expressed by a person, which can be an opinion, idea, emotion, physical sensation, parent/ child, teacher/ student, and so on. An individual usually holds more than one role and one role is usually held by more than one individual.  The roles of the participants need to be fluid and shared:  - If one person is alone in a role, it may become a burden to that person.  - If roles are too fixed, the organisation or group isn't growing.  - The role of the facilitator in the method is to help people make their roles more fluid, to become aware of their own roles and the roles of the others, to understand their interdependence.  Major principles of the Deep Democracy are:  1. In traditional majority democracy, people vote and then move forward with a decision. In Deep Democracy, the facilitator should encourage the minority voice to be expressed.  2. The facilitator needs to encourage people to express their disagreement; the participants should not feel afraid to say "no".  3. Once somebody expresses their disagreement, the other participants are also asked whether they agree with it. This process' aim is to avoid scapegoating and people being singled out and ostracised for disagreeing. The idea is to bring the present conflict on the surface and encourage everybody to express their concerns and opinions so that these can be heard by the other participants and possibly be addressed.  4. When the majority decides to follow in a certain direction, the minority is asked what they need in order to go along with the majority. The minority elaborates on the decision which has been taken by the majority, helping the group to come to a more conscious decision.  5. When a participant speaks in a way that is indirect, the facilitator goes in and speaks for that person, amplifying what they are sayi

# Name of the engagement method (alias)

#### 17. Deliberative Mapping

#### Short description of the method

Deliberative Mapping (DM) involves both specialists and members of the public. It combines varied approaches to assess how participants rate different policy options against a set of defined criteria. The method allows substantial involvement of public participants in shaping the scope of the questions discussed.

#### Long description of the method

#### Description

Deliberative mapping originated in social research, and is based on Multi-Attribute Decision Analysis (MADA). The process is designed to assess a complex problem for which there is no single obvious way forward to judge how well different courses of action might perform according to a set of economic, social, ethical and scientific criteria. The aim is to use the process as the basis for more robust, democratic and accountable decision making which better reflects public values.

Fundamental to this approach is the involvement of both 'specialists' and members of the public. A sample of the public (around 40 people) from varied backgrounds is recruited onto citizens' panels. The experts (around 20) are selected to reflect on the full spectrum of specialist knowledge in an area. The citizen and expert participants are divided into panels (often according to gender and socio-economic backgrounds). The citizens' panels, and the experts, consider the issue both separately from one another and together at a joint workshop. This process allows both groups to learn from each other without the experts dominating. The emphasis of the process is not on integrating expert and public voices, but understanding the different perspectives each offer to a policy process. The process aims to avoid problems which feature in other participatory methods such as expert-dominated discussion in other participatory methods and is able to deliver both an overview and indepth analysis of public opinion.

#### Participants:

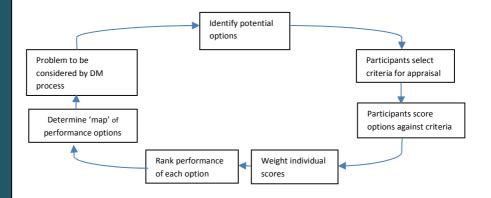

- Decide in groups, through a deliberative process on criteria they will use to score the policy options against (policy options are likely to have been developed by experts and policy makers working in the field);
- Systematically weigh up the pros and cons of each of the potential 'options' under consideration;
- integrate their individual assessments to help identify a possible future course of action.

Deliberative Mapping incorporates both quantitative and qualitative methods. The approach integrates two independent but complementary approaches to informing decision making:

- Stakeholder decision analysis (SDA) which is a qualitative group based process (see additional information);
- Multi-Criteria Mapping (MCM) which is a quantitative, computer-assisted interview process.

#### **Process**

Citizens and specialists follow the same basic framework for optional appraisal:

Citizens' Panels and Joint Workshop:

- Meeting 1: Introduce panellists and facilitation team, agree ground rules, discuss initial thoughts about problem in question and provide information;
- Meeting 2: Clarify, discuss and then agree meanings, definitions and implications of the options to be appraised;
- Meeting 3: Discuss and agree a shared set of criteria to be used by the panel to judge the pros and cons of the

	<ul> <li>different options;</li> <li>Meeting 4: Panellists score options under chosen criteria. Panel reviews performance patterns then decides what issues to take to joint workshop;</li> <li>Joint workshop: Panellists join specialists to discuss issues raised in their deliberations;</li> <li>Meeting 5: Discuss workshop outcomes, then the panellists re-score options and weight criteria to reflect priorities;</li> <li>Meeting 6: Panellists discuss individual and full panel results. They evaluate the process.</li> <li>Specialists' Interviews and Workshops:</li> <li>Scoping interview: Discuss project and views about the problem in question;</li> <li>First MCM interview: Use MCM (Multi-Criteria Mapping is a quantitative, computer-assisted interview process software) to structure the appraisal of options under weighted criteria;</li> <li>Joint workshop: Specialists exchange views with citizens and respond to questions;</li> <li>Second MCM interview: Use MCM process to elicit any changes in specialist appraisals;</li> <li>Specialist workshop: Specialists reflect on the various perspectives and emerging findings; they evaluate the process.</li> </ul>

What are the issues of concern that organisers need to take into account when applying the method?	Deliberative Mapping is a demanding process;- it is complex, time consuming and expensive. It requires strong project management and high quality facilitation skills. It can be demanding on sponsors, practitioners and participants, particularly if the issue being discussed is controversial. On the plus side, it allows a structured and in-depth exploration that most other methods don't. Here are a number of key issues which policy makers and researchers should consider before using Deliberative Mapping to investigate citizen and specialist perspectives on a particular issue:  Recruitment of panellists – socioeconomic and demographic characteristics should inform the criteria for recruitment to ensure diversity;  Understanding of the perspective of panellists – facilitators need to make it clear to participants that their contribution is valued (valuing all opinions, maintaining confidentiality, sharing results with participants);  Providing quality information (this might include specially prepared booklets, as well as providing space for questions to be answered);  Quality and level of facilitation – this will involve supporting participants at all stages, creating a safe space, enabling dialogue, supporting group development, and resolving conflict;  Evaluation is critical at all stages from design to implementation and analysis;  There is no guarantee that the outcomes will be fed successfully into the policy-making process.

Additional information of relevance (such as historical background, where the method has already been applied, etc.)	The first application of Deliberative Mapping in the UK was to the problem of the 'kidney gap' – the disparity between the number of people waiting for a kidney and the much lower number of kidneys available. Thirty eight citizens and seventeen experts agreed to attend six evening meetings and a one day joint workshop to assess the performance of different options. This application demonstrated that quantitative and qualitative appraisal techniques, and individual and group-based methods, can be combined to form a deliberative and inclusive process. This process produced a high level of agreement between specialist and citizens which may not always occur in every context, but the results will always provide a detailed picture of relative performance of different options.

Name of the engagement	18. Deliberative (Mini-publics) Workshops						
method (alias)	*The method might also be referred to as Public Dialogue Workshops in the UK, Deliberative Policy Workshops or upstream engagement.						
Short description of the method	Deliberative Workshops refer to dialogue events where the focus is on having in-depth informed discussions on a complex or controversial issues to gather social intelligence to inform policy, anticipate regulation, exchange opinion or raise awareness. Deliberative workshops have also been used to develop research agendas and objectives that more closely reflect public views (see for example Sciencewise <a href="Drug Futures Dialogue">Drug Futures Dialogue</a> ). Deliberative Workshops developed out of focus groups and other related methods as a more in-depth and deliberative alternative.						
Long description of the method	Deliberative Workshops are a form of facilitated group discussions that provide participants with the opportunity to consider an issue in depth, challenge each other's opinions and develop views and arguments to reach an informed position. They allow the organisers conducting the event to have a greater understanding of what may lie behind an opinion or how people's views change as they are given new information or deliberate on an issue. Deliberative Workshops can be similar to focus groups, although there tends to be a greater emphasis on deliberation.						
	Participant Selection: Forming a Mini-Public  Deliberative workshops often involve recruiting a group of people that broadly reflects a wider population – these are often referred to as 'mini-publics' (see additional information section below for a more detail explanation). Deliberative Workshops typically involve 8 to 16 participants (although it can be larger). The choice of participants will depend on the issue at stake; participants could be selected on the basis of demographics, interest group or through a random selection. Random selection is often used to overcome bias (although this can add significant costs to the process), this is intended to create a group that is an inclusive different opinions representative of a wider population – these are often referred to as mini-publics. In some cases participants are recruited to reflect affected groups (e.g. in <a href="DNA Database Dialogue">DNA Database Dialogue</a> where Black males were recruited for a separate group as they were disproportionately targeted in the database).						
	Process  The format usually involves presentations of information from 'experts'. Any experts presenting or observing are briefed beforehand so they clearly understand their role. The majority of time is allocated to participants' discussions. These may take the form of plenary and/or small group discussions (depending on the size of the group). Expert facilitators ensure there is enough time for everyone to express their views and that all views are valued equally (not just that of 'experts'). Discussions are carefully recorded.						
	There are many tools and techniques used in deliberative workshops and those chosen will depend on the size of the group and nature of the topic. Ideally, organisers should vary the ways in which participants can express their views throughout the process – collectively in group discussions and individually through other methods such as voting, postcards, flipcharts and post-it notes. Plenary feedback and summing up is used so that participants can check and validate points that are being interpreted as the main results.

What are the issues of concern that organisers need to take into account when applying the method?	<ul> <li>There are various considerations to make in advance of a deliberative process. For example, organisers and facilitators should:</li> <li>Be aware the recruitment for deliberative workshops can be time consuming and expensive, particularly if using random selection or purposive sampling; sometimes organisers pay participants a small amount of money to incentivise participation which can add significantly to costs; other costs incurred by participants include childcare and organisers may also cover these to ensure inclusivity;</li> <li>Be aware as to whether a workshop will influence decisions and make this clear to participants; tokenistic deliberation can reduce the trust of participants in those taking the decisions;</li> <li>Participants are kept informed after the event; summaries of the views should be provided and it should be made clear to participants how their input has made a difference;</li> <li>The participant's views are developed through deliberation and the processing of new information and arguments and this may mean they are not representative of the views of the wider public and should therefore not be claimed as such;</li> <li>Building in evaluation to the process can help assess outcomes and improve future practice.</li> </ul>

Additional information of relevance (such as historical background, where the method has already been applied, etc.)	The term mini-public is contested. Definitions often refer back to Robert Dhal's vision of the 'minipopulus'. The term refers the group of participants who are involved in a range of different public engagement designs with very different democratic qualities and functions, these include: deliberative polls (random selection of 250-500 citizens brought together for 1-2 days to hear evidence from experts and deliberate in small groups), Citizens Assemblies, Planning cells, citizen juries, consensus conferences and 21st century town meetings. A more expansive definition may also include participants involved in participatory budgeting and Chicago Community Policing.  For further explanation see <a href="https://www.academia.edu/3999460/Defining Mini-publics Making sense of existing conceptions">https://www.academia.edu/3999460/Defining Mini-publics Making sense of existing conceptions</a>

Name of the engagement method (alias)	19. Deliberative on	line forum						
Short description of the method		Web-based discussions in online forums between informed individuals about issues which concern them, leading to some form of consensus and collective decision.						
Long description of the method	Features of deliber	ation						
	It is argued by deliberative theorists that one of the necessary features of democracy is indeed publicit main arguments are that issues in a democracy should be publicly debated and recognized, just like processes in democratic institutions should be public and subjects to critical observations. Moreover, no citizens need to be provided with information, but also ensured that the use of a public form is the method to ground political decisions, rather than rely on sources of authority available only to a segment society. The public nature of the reason used to ground political decisions generates outcomes that are far reasonable but subject to revision if warranted by new information or further deliberation. It is believed that the most reasonable political outcomes are generated when there are a strong inclusive citizens and variety of viewpoints. The more-inclusive deliberative processes, the fairer they are as viewpoints are taken into account. It doesn't really matter whether a citizen's view is present in the outcomes at least been figured into the debate by fellow citizen deliberators.							
	sought by public ir conducted and acte	nput and the social a	ng public deliberation. T nd institutional contexts portant constraints. Ther d contexts at hand.	within which a public	deliberation might be			
	Deliberative forums usually consist of facilitated, democratic conversations during evaluative inquiry. The principles of democratic pluralism are reinforced by consciously positioning people with different opinions and authority in evaluative discourse. The methodology of the deliberative forum is an instrumental tool for bringing the theory of deliberative democratic evaluation into practice. Deliberative forums can be reformulated throughout the inquiry of an evaluation, but most commonly they are useful when crafted into the unfolding dialogue during the design. The main goal of the deliberative forum is the differences of perception among evaluation stakeholders.							
	Elements

relevance (such as historical background, where the method has already been applied, etc.)	Deliberative theorists tend to argue that publicity is a necessary feature of legitimate democratic processes within a democracy should be public and should be publicly debated. Second, processes of democratic institutions must be public and subject to public scrutiny. Finally, in addition to being provided information, citizens need to ensure the use of a public form of reason to ground political decisions, rather ely on sources of authority available only to a segment of the citizenry. The public nature of the reason us ground political decisions generates outcomes that are fair and reasonable but subject to revision if warr by new information or further deliberation.  Most theories of deliberative democracy hold that the maximum inclusion of citizens and viewpoints generate most legitimate and reasonable political outcomes. In addition to improving the level of discussion accounting for the most arguments, more-inclusive deliberative processes are fairer because more people their views considered. Whether or not a citizen's view is present in the outcome, it has at least been file.					

into the debate by fellow citizen deliberators. The first citizens' forums emerged in the mid-1970s from the area of planning and technology assessment in the form of Planungszelle (Planning Cells). Since then a range of innovative processes have been developed, including consensus conferences, citizens' juries, and a number of hybrid methods. Whilst there are some differences between these processes, they seek to bring a small panel of randomly selected lay citizens together to deliberate on a policy issue. After hearing from, and questioning a number of experts such as academics and interest groups, the citizen panel develops a set of written recommendations. This document then feeds into the policy process either directly (eg. tabled in parliament) or indirectly through wide public dissemination. Name of the engagement method (alias)	20. Deliberative Po	ll (Deliberative Polling	(°)				
Short description of the method	_	Deliberative Polling®, developed by James Fishkin, is a method which combines deliberation in small group discussions with scientific random sampling to provide public consultation for public policy and for electoral issues.					
Long description of the method	Deliberative Polling is a method which combines deliberation in small group discussions with scientific random sampling to provide public consultation for public policy and for electoral issues. The main characteristics of a Deliberative Poll include random recruitment of participants, informational input about the issues discussed in balanced briefing materials, moderated small group discussions, plenary sessions in which questions from the small groups are answered, and repeated attitude measurement. A control group and a systematic recording of all verbal interactions is a common feature in most cases (also in the small group discussions).  Deliberative Polls make a systematic effort at recruiting a random and representative microcosm, often referred to as a mini-public, of the reference population. It is large enough to allow for statistical procedures to be used and for the evaluation of both representativeness and opinion changes.  The process begins with a baseline poll, in which members of the sample are invited to gather at a single place for a weekend in order to discuss the issues. Briefing materials are sent to the participants and are also made publicly available. The participants engage in a dialogue with competing experts and political leaders based on questions they develop in small group discussions with trained moderators. Parts of the weekend events are broadcast on television, either live or in taped and edited form. After the deliberations, the sample is again asked the original questions. The resulting changes in opinion represent the conclusions the public would reach, if people had the opportunity to become more informed and more engaged by the issues.  The process should have the statistical representativeness of a scientific sample but it also should have the concreteness and immediacy of a focus group or a discussion group. Taped and edited accounts of the small group discussions should provide an opportunity for the public to reframe the issues in terms that connect with ordinary peo

Name of the engagement method (alias)	21. Delphi method (also called: Delphi technique, Delphi survey)							
Short description of the method	expert opinion w discussion and end	The Delphi method is a multiple iteration survey method that enables anonymous, systematic refinement of expert opinion with the aim of arriving at a combined or consensual position. Its purpose is to generate discussion and enable a judgement on a specified topic to be made so that policy decisions can be taken which can claim to represent a given group's wants and views.						
Long description of the method	making processes. input. The Delphi as a means of ob contribution to n extensively used	There are four features which characterize the Delphi method and distinguish it from other group decision making processes. They are anonymity, iteration with controlled feedback, statistical group response and expert input. The Delphi method is presented as an alternative to the committee process or the one-off questionnaire as a means of obtaining a group's opinion or judgement on a topic. It is often seen as having an important contribution to make in facilitating controlled and rational group communication. The method has been extensively used for exploring policy issues and facilitating decision making by business organisations and government agencies, as well as foresight studies.

Name of the engagement	22. Democs card ga								
method (alias)	(also called: Deliber	ative Meeting Of Citize	ens)						
Short description of the method	Democs is both a card game and a policy-exploration tool that enables small groups of people to engage with complex public policy issues. It aims to help people find out about a topic, express their views, seek common ground with the other participants, and state their preferred policy position.								
Long description of the method	Democs is a conversation game developed by the New Economics Foundation (NEF) that helps small groups discuss public policy issues. No speakers or experts are needed, as prepared cards contain all the necessary facts. It works best for six people over two hours, but it is flexible. It is a low intensity process which allows people with no pre-existing knowledge to take part in a relatively short period of time.								
	Usually Democs processes are open to anyone, but sometimes specific groups are sought on particular issues. Individual sessions take 1 to 4 hours. There are already a number of Democs kits on different issues which can be bought or downloaded for free from NEF or Play Decide. Developing a new kit can cost between £5-10,000. Recruiting participants and analysing the results would require additional resources.								
	process involves a n  1. The informatio people reflect of 2. Participants tal the table.	people reflect on their cards and choose one or two that they feel are most important.  2. Participants take turns to read them out, explaining why they have chosen them, and then place them on the table.							
	<ol> <li>Next participants cluster the cards, with each group representing a key issue relating to the topic.</li> <li>Participants then vote on a range of responses or policy positions and try to create a response that everyone in the group can agree with.</li> </ol>								
	Finally participants fill in a short form explaining the results of the discussion and send them back to the organisation running the Democs.

# Name of the engagement method (alias)

#### 23. Distributed Dialogue

#### Short description of the method

Distributed dialogue is an approach to public engagement that aims to develop ongoing, embedded discussions around a topic; parts of the engagement are often self-organised by groups of participants. The approach aims to engage a wide range of research communities, stakeholders and members of the public to inform strategy and policy development. It often involves a number of dialogue events organised by researchers and other interested parties, held across different geographic areas and through a range of mediums.

#### Long description of the method

A number of science-based consultations have involved elements of distributed dialogue, whereby stakeholders, citizen groups and others, external to the organiser, set up their own events to discuss a topic. These efforts have been driven by the limitations of more traditional methods, which include: a lack of flexibility and innovation, audiences confined to recruited or well-organised groups; limited numbers of researchers that can be involved; high costs of centrally organized events, and the top-down nature of traditional consultation and engagement methods.

A distributed dialogue approach is based on the idea that complex issues need to involve a range of conversations that happen in different spaces. This is intended to give multiple entry points for citizens and other stakeholders to take part. Dialogue which is dispersed across multiple local areas, will ensure that larger numbers of people can engage meaningfully in the debate and will tap into the expertise and experiences of a wide range of people.

Common characteristics of a distributed dialogue are:

- Devolved this involves connecting with a variety of actors, for example community activists, who will
  be able to reach citizens at the local level. A clear channel to communicate results will need to be
  established to feed conversations back into decision making processes and also communicate decision
  making processes back to participants.
- Well promoted it is essential to promote activities to potential participants and wider audiences
  through mass media. This will help a dialogue process to reach beyond the 'usual suspects' (see
  Pathways Through Participation for more information on what factors promote or block the
  engagement of citizens). Engaged participants can then take conversations deeper into communities.
- Collaborative distributed dialogue should promote a shift towards a long-term participatory
  relationship between citizens and decision makers which moved beyond the view of citizens as
  sources of information. Success will require building the capacity of confidence of citizens to engage
  with debates.
- Open rather than closed a distributed dialogue should be built upon with both top-down engagement and bottom-up approaches.
- Of mixed methodology a distributed dialogue is not a new methodology; rather, it is a framework within which decision makers, citizens and other stakeholder can work together to solve complex problems.
- Influential the outcome of the dialogue must be linked to decision making cycles.
- Continuous dialogue should also move from one-off engagement towards more ongoing conversations (although the overall process usually has an end point).

Distributed dialogues often have toolkits that can be used by external groups to develop dialogue events in collaboration with academics and science communicators. Often these decentralised events run in parallel with events organised from the centre. Toolkits usually include guidelines for running events, a set of future scenarios and associated discussion materials.

Distributed dialogues are likely to involve a range of methods and approaches, including:

- Deliberative engagement exercises held across different regions which might invite participants to
  engage with debates around an issue and formulate workable policy recommendations;
- Devolved activities, for example through local civil society organisations or schools and supporting these groups by making venues available, providing materials and advice and providing funding;
- Setting up an online forum to allow a wide range of people to join the conversation;
- Working with existing networks to promote dialogue involving a wide range of voices in a number of local areas.

For a more detailed discussion of distributed dialogue including case studies and a typology of issues see <u>Talking</u> For a Change.

Objective of application of the method	☑ Policy formulation ☐ Programme development ☐ Project definition ☐ Research activity ☐ Others:							
Results and products of the method application	<ul> <li>A distributed dialogue can lead to decision making that is informed by a range of perspectives and policies that therefore better meets the needs of ordinary citizens.</li> <li>Complex issues will have a range of impacts and repercussions at a number of levels and a distributed dialogue approach can allow action at these different levels.</li> <li>A distributed dialogue can lead to processes in which a wide range of community leaders feel a shared ownership and responsibility of their areas and motivation to take action.</li> <li>A distributed dialogue could potentially contribute to strengthening and improving representative democracy.</li> </ul>

Additional information of relevance (such as historical background, where the method has already been applied, etc.)

The UK Biotechnology and Biological Social Research Council (BBSRC) created an ongoing, embedded discussion between BBSRC, its research community, the public and other stakeholders that would engage a larger number of researchers and members of the public in a cost effective way. The following is a typical event structure that other organisers could follow when setting up workshops of their own:

- An introduction: a brief explanation of the aims of the dialogue project, expected outcomes and overview
  of the event structure;
- The scenarios: Participants are split into groups of 6-8 people, usually with one facilitator (responsible for guiding the discussion) and one researcher (responsible for providing information on bioenergy, if participants ask). They are asked to read one of the scenarios either as a story or a short play. Facilitators use 'cue cards' and 'character cards' to help encourage discussion. The scenarios can be used in different ways and it is up to the facilitator to decide which resources to use and how to use them. A voting-type activity is often used to help clarify the issues (by writing them down) and help participants think about which are the most important to them. This is often the focus of the plenary discussion which is encouraged.
- Feedback: 10-15 minutes are recommended to allow participants to fill in the feedback forms. These
  capture views, demographic information, information about the event and process (i.e. how materials
  were received) and perceptions about what the impacts of the dialogue might be.

Name of the engagement	25. Focus Groups						
method (alias)	(Tool)						
Short description of the method	The focus group is a qualitative method which is used to determine the preferences of people or to evaluate strategies and concepts. The method has originally been designed for market research. Participants are selected according to certain characteristics in common that relate to the research topic and are grouped into 8-10 people. The method is often used to generate or evaluate hypotheses and ideas.						
Long description of the method	The focus group is a method similar to needs assessment surveys and is designed to help learning more about community and groups preferences and opinions. The participants' responses to a certain topic are typically spoken, qualitative and open-ended, therefore the information is open to more interpretation. The answers have more depth, nuance, and variety. Group interactions and non-verbal communication can also be observed. The focus groups can reveal what the participants are really thinking and feeling, even though their responses may be harder to score on a scale.						
	There are 3 main characteristics of the focus groups:						
	<ul> <li>The group focuses on a specific topic;</li> <li>There is a facilitator (or trained leader) and his/her job is to keep the group focused on discussing the specific topic;</li> <li>There is some careful planning behind the group's composition and the group discussion in order to create a nonthreatening environment, in which people are free to talk openly. Members are actively encouraged to express their own opinions, and also respond to other members, as well as to questions posed by the leader.</li> <li>The focus groups are structured and directed, but in the same time expressive, therefore they can gather a lot of in-depth information in a relatively short time. The method is often used to generate or evaluate hypotheses and ideas and the information can be used in various fields. In the end of the focus group discussion, the information should be written, summarized and eventually put in a report.</li> </ul>						
Objective of application of the method	☐ Policy formulation ☑ Programme development ☑ Project definition ☑ Research activity ☐ Others:						
Results and products of the method application	<ul> <li>A summary of the group results;</li> <li>Research data;</li> <li>Reliable knowledge on people's preferences with regard to the technologies, risks and chances, problem solutions of the specific research topic;</li> <li>The method allows direct observation of the participants' reactions during the focus group session, which adds to the data collected via the method.</li> </ul>

Name of the engagement method (alias)	26. Future Panel
Short description of the method	A future panel includes all political parties within a national parliament and creates a collaborative framework between politicians, experts and CSO's in the form of a temporary committee. The goal is to create a space for the politicians to debate freely and bring knowledge from societal actors and experts on a societal challenge together. This will open a venue for reflection, far-sightedness and visions for the parliament in a specific field.
Long description of the method	At a future panel, the parliament appoints up to 20 MPs which, over a period of 2-4 years, is charged with carrying out a long-term, cross-sectorial, cross-party project. The future panel arranges from 3 to 4 public hearings, two or more seminars, and several hearings on the societal challenge, involving experts and CSO's in knowledge building, planning and performing.
	The project creates an overview of the political tasks connected with the social or political challenge. This process requires visionary thinking that crosses the boundaries of different sectors, spheres of competence, and professional disciplines.
	Project management The project management team consists of a project manager, a project assistant, a secretary and an information project manager. The management team records the hearings and gathers up the discussions. This provides for a consultation document for the future panel's concluding debates.
	The future panel  The parliament appoints up to 20 MPs from all political parties and selected parliamentary committees for the future panel. The panel is involved in organizing the project, participates in seminars and hearings, and has a central role in the formulation of strategies and political action proposals.
	Steering group  The steering group comprises some of the key players among experts and CSO's within the subject area, and assists the management team in collaborating with the future panel, organising hearings, and in the collation and the presentation of results.
	Introductory seminar  At the introductory meeting, the steering group and future panel create a draft for the coming project and decide the general content for the four hearings.
	Hearings At the four hearings, the politicians serving on the future panel question a panel of experts and CSO's. Two future panel chairmen are appointed for each hearing.
	Immediately after each hearing, the future panel, the steering group, and the project management meet to evaluate what was learned at the hearing, and use this insight in order to plan the next hearing. A newsletter is published after each hearing and sent to parliament and the public.
	There are also midterm seminars to organize the hearings.
	Concluding seminar  Following the four hearings, the future panel, the steering group and the management team organise a concluding seminar to produce a joint report on the political challenges addressed at the hearings.
Objective of application of the method	☑ Policy formulation ☑ Programme development ☐ Project definition ☐ Research activity ☐ Others:
Results and products of the method application	Direct results  The results reflect the discussions between the politicians. The future panel presents robust solutions that have undergone a thorough calculation and review by several institutions.  The involved politicians and the actors from the steering group produce well-balanced ideas that are realistic and ambitious. There is a close dialogue between the steering group and the MP's in the future panel.
	The work of the future panel is documented in a report that is published. The report can form basis for the debate in the parliamentary committees. There is also a report produced from each hearing containing a summary, a transcript from the hearing and written presentations by the hearing's experts. Policy briefs/

	newsletters are produced during the process.  The reports are distributed to MPs, hearing participants, government ministries, research institutions, interest groups and other interested parties.  Indirect results  The results can form the basis for more sustainable solutions and be relevant for the parliament, the government, and legislature's committees.  In addition to the hearings, other activities can be arranged for concerned citizens, the press, experts and other interested parties. This can lead to greater public awareness about the particular problem.  A future panel allows for discussions, disagreements and new turnings to find a common ground for important challenges in the future.  The process opens the door for the involvement of politicians and representatives from different actors within the field of work, who have different objectives, opinions and calculations.

The work of the future panel can be compared to the work of a commission. This secures politically relevant

work as the future panel contributes to an ongoing discussion between politicians and other interested parties. This allows project ideas and suggestions to emerge in the public debate during the course of the project.

Strengths

Specific **strengths and** 

weaknesses of the method vis-à-

vis the challenge(s) addressed

The method is well suited to far-reaching problems. The subject theme should also require central political initiatives and action.

With the future panel method, the policy-makers get the chance to have a serious dialogue with experts and CSO's engaged in the societal challenge at stake. This process prevents lobbying and biased agendas, as the politicians get a thorough knowledge of the subjects. With the future panel, the politicians get the possibility to research and collaborate with the experts and stakeholders within the framework of a trustworthy relationship.

The future panel opens up an honest and broad discussion with the possibility to weigh different suggestions, and also the pros and cons of each.

The future panel organises both hearings, open for the public, but also seminars and meetings behind closed doors with only experts and stakeholders. This provides the politicians with broad knowledge from all parts of society.

### Weaknesses

It is only relevant to form a future panel if there is political agreement, as all political parties in parliament have to participate for the future panel to happen. The process is very time consuming, expensive and requires a common understanding and commitment prior to the activities and challenges.

The method generates ideas on a general political level, which are important for new political activities, legislative processes and research programs. The level of detail in this model is not very high. Other methods can give more detailed results.

### Timeframe for the application of the method

The timeframe can change during the project and the following timeline is to be regarded as a loose guide. It is possible to arrange the hearings and seminars in a different order and to have more seminars.

Month 1: Introduction seminar for future panel and steering group.

Month 4: First hearing.

Month 9: Seminar with the future panel and steering group.

Month 13: Second hearing.

Month 16: Third hearing.

Month 19: Forth hearing.

Month 21: Concluding seminar.

Month 24: Final report.

What are the issues of concern that organisers need to take into account when applying the method?	It is time consuming to implement the future panel. You need commitment from all political parties in parliament before you can start the actual future panel. This part can take several months. There is many sub elements in the method as seminars, hearings and meetings. All these elements require preparation before implementation and thorough work when finishing the process.							
	It can be challengi parties.	It can be challenging to have different future panels overlapping as they require intensive commitment from all parties.						
	The theme of the	future panel has tended	to be of great societal i	mportance and with a b	proad political interest.

Name of the engagement method (alias)	27. Future Search
Short description of the method	The purpose of the method is to encourage participants to think about a problem or conflict in a new way. Participants who come from various stakeholder groups must abandon their usual rhetoric and open their minds to new ideas and action proposals which can gain wide support. The aim of the conference is to find a common basis which all the participants can endorse. Participants do not seek to solve their disagreements. These are "set aside" so that the time can be spent on constructive and insightful debate. Suitable for locally embedded conflicts in which the problem, the key players and decision makers are identified.
Long description of the method	The future search conference lasts for 3 days. The conference starts on the afternoon of the first day, continues the whole next day and ends on the third day at noon. A feature of the conference is that 2 days' work is fitted into 3 days to enable the participants to rest between the sessions.
	The conference usually brings together 60-80 participants (it could also be done with hundreds of participants in parallel rooms) from different stakeholder groups. In the ideal case, these would be represented by equal numbers of participants so that throughout the conference the participants can switch between peer groups and mixed groups.  Basically, there are three major types of stakeholders:
	persons with professional knowledge and information;
	<ol> <li>persons with authority and resources for action;</li> <li>persons who are or will be influenced by the conference and its results.</li> </ol>
	The conference programme comprises 5 phases, each with its own separate task:
	1. Recalling the past
	In the first phase, the participants establish a personal relation with the given theme and reflect upon the most important local and global historical milestones in relation to the problem. The aim of the discussions and subsequent milestone reviews is to establish a common experience of the past among the participants and thereby create the stepping stone for the next phase.
	<b>2. Examining the present</b> The second phase is a mind mapping session in which all participants contribute. The purpose is to map current trends influencing the conference theme. Each participant indicates the seven trends they deem the most important. Thus, participants assess the trends and choose how they should be prioritized. By the end of the second phase, each participant has thus contributed in the production of a collective consensus regarding the problem.
	3. Create ideal future scenarios
	In the third phase, the groups create future scenarios. They ought to be realistic, not utopic, and only concerning trends the group members can come to an agreement about. Participants then discuss the positive aspects of current behavior in terms of the specific scenarios – as well as areas that need to be improved.
	4. Identify common visions or projects people have jointly agreed to work on.  The next step is for mixed groups of participants to consider a desired future scenario in relation to the conference topic. The groups imagine how the situation will look like in ten years. The task involves imagining which remedies to use to create the perfect future scenario as well as imagining the barriers and challenges that must be overcome to reach this future goal. The groups continue working on their visions and may convert them into common projects.
	5. Prepare action plans On the third and last day, participants are asked to write down which of the suggestions from the previous day they wish to continue working on. They must differentiate between short- and long-term initiatives. Participants jointly discuss possible initiatives and actions relevant and possible.
Objective of application of the method	☑ Policy formulation ☐ Programme development ☐ Project definition ☐ Research activity ☐ Others:
Results and products of the method application	Direct result:  Using a carefully orchestrated process, the conference results are written down on flipcharts, timelines and mind maps. The conference ends with each group presenting 1 or 2 proposals for a common platform, which is then discussed in a plenum. The common features and common understanding of the plenum represent the conference result.  Indirect result:

	The conference sets t	he basis for a strong	network of the main ac	ctors and stakeholders in a	a certain field.

# Additional information of relevance (such as historical background, where the method has already been applied, etc.)

[The Heino Apel article could be used for further background information]

"The future workshop is a futures technique developed by Robert Jungk, Ruediger Lutz and Norbert R. Muellert in the 1970s. It enables a group of people to develop new ideas or solutions of social problems. A future workshop is particularly suitable for participants who have little experience with processes of creative decision making, for example children or youth. However it requires an intensive preparation and support by trained moderators. It is used in spatial planning to involve citizens in the planning process."

"Future Workshop - Wikipedia, the Free Encyclopedia." Accessed September 18, 2014. http://en.wikipedia.org/wiki/Future\_workshop.]

See also the Engage2020 Scenario Workshop fact sheet. The scenario workshop developed by the Danish Board of Technology is a further development of the future workshop. It follows the same 3 basic phases: the critical analysis phase, the visionary phase and the implementation phase. The main difference between a scenario workshop and a Futures Workshop is that it is based on scenarios of future technological development in the area. Scenarios are formulated in advance. Participants' own experiences and criticism of these scenarios form the basis for future visions and action plans.

Name of the engagement method (alias)	29. Group Delphi (also called: expert	Delphi, expert worksh	op; in German: Gruppen	delphi)				
Short description of the method	A group Delphi is a variation on the conventional Delphi exercise which is designed to consolidate expert opinion in a short time period. The Delphi technique, of repetitious questionnaires and feeding results back into the process, is exploited to encourage consensus about particular issues. What is typical for the Group Delphi is that the aspect of anonymity is given up, scaling is employed to define deviant opinions, and the feedback process is conducted as a conference.							
Long description of the method	and trend forecast	Delphi has been used extensively to resolve uncertainty about future conditions. Besides technological event and trend forecasting, the Delphi process has been used to evaluate budgets, define policy options, expose hidden agendas, and assess the significance of past events.						
	The Group Delphi is a variation on the conventional Delphi exercise which is designed to consolidate expert opinion in a short time period. In the Group Delphi, the feedback process is conducted as a conference. The Group Delphi process is efficient at bringing about consensus because of its two-tiered structure. Participants need expert/scientific knowledge in the field discussed at the Delphi workshop. All participants should have a more or less equal status, which is dependent upon careful recruitment. Experts are initially brought together in a plenary where the process is introduced and questions are answered. Next they are divided into several small groups and given the questionnaire. Each small group works in a private room and is instructed to try to reach consensus on each question, although majority/minority votes are allowed in the first round. The plenary is reassembled and the moderator presides, systematically reviewing the questionnaire results, identifying deviations, and asking the subgroups to justify their positions. The expert panels are asked to use known cause-effect relationships to extrapolate conditions of likely scenarios within scopes of predefined epistemological frameworks. The moderator permits discussion when it may be helpful in having the group reach consensus, but when it is clear that two camps are firmly established, the moderator redirects the group focus to the next item. In the second round, the membership of the small groups is shuffled and the questionnaire can be redesigned during the plenary. The results of the second round are assessed as before, and the plenary review process is repeated. This tends to move much faster as, on many points, consensus is achieved in the first round.

	Climate a efficiency and	ction, resource raw materials	☑ Inclusively reflective series	e, innovative and societies	☑ Secure societies t protect freedom an security of Europe an its citizens	d		
Specific strengths and weaknesses of the method vis-à-vis the challenge(s) addressed	There are three major advantages to having face-to-face communication instead of a conventional feedback process. First, criticism of the conventional Delphi is that information from respondents may be distorted intentionally or unintentionally, by the moderator; because views are discussed openly in the Group Delphi there is direct and immediate feedback. Any ambiguities are immediately clarified. Second, the justification given for dissenting viewpoints also give secondary insights into which deviations are accepted by the pane Third, these discussions provide an internal check for consistency in accepted viewpoints.  A group Delphi is efficient at bringing about consensus because of its two-tiered structure.  A group Delphi is an effective technique for reducing uncertainty surrounding knowledge about predictions an interpretations.  A group Delphi captures justification given for the dissent.  Heavy emphasis is placed on assembling an expert panel that represents all points of view (difficurecruitment).							
Timeframe for the application of the method	Unlike the conventional Delphi, it demands that the anonymity of the panel be given up.  Recruitment: 3 – 4 months before the workshop; Data analysis: 1 week; Questionnaire design: 2-3 months (Optional: Pretest: Saves time at the workshop itself).  Workshop: 1-2 days; Optional: Feedback on results by the panel: 1-2 months.

# Name of the engagement method (alias)

### 31. Interdisciplinary Work Groups

### Short description of the method

The purpose of the method is partly to take professional stock of the situation and partly to propose possible courses of action to ensure, initiate, promote or check development in the area. The work of the group is rooted in the existing knowledge base. The interdisciplinary work group is independent, problem-oriented and focuses on solutions – not only assessment. The method is suitable for intersecting topics, traditional institutional and disciplinary lines and creates holistic robust recommendations. Useful for political/strategic development.

### Long description of the method

The organizing partner appoints an inter-disciplinary work group so that an assessment is carried out by several specialists with different approaches to the subject (both stakeholders and professionals with academic background).

### When to use the method?

The method is suitable for topics requiring professional assessments intersecting traditional sectors, institutional authorities, stakeholders and disciplinary lines. Therefore, the topic is large and is often related to a broader problem than a single technology or legislation, etc. which has to be assessed. It needs to be a problem characterised by a societal agreement on the idea that "something" needs to be done – without having a clear idea about what exactly to do. Often there will be a requirement for collection of existing knowledge covering the field.

### Work group members

The interdisciplinary work group consists of 5-8 specialists appointed by the organiser. The term specialists are taken to mean traditional experts who carry out research in the subject area at universities and institutions of higher education, civil servants and people from organisations with a vested interest in the area. Members are personally selected and thus do not represent their respective institutions or organisations. To ensure an interdisciplinary holistic assessment and a treatment of all aspects of the topic, it is crucial to appoint group members on the basis of different technical approaches, knowledge and networks. If the group members feel there is an insufficient basis for professional assessment of the topic, more experts can be appointed to the group. Sometimes the group appoints a chairman from among its members.

The organiser appoints a project management team that guides and assists the work group. A writer, such as a science journalist, may be appointed to shape the content of the report – based on the concrete guidelines of the work group

The work group is characterised by a shared commitment to produce the analysis and recommendations and writing the final report itself. Thus, the work of the work group is broader than a traditional advisory board.

### **Process**

The method involves 4 phases: preparation of the first analysis, midway seminar, preparation of the final analysis, and publication of the analysis i.e. at a conference. The group decides what goes into the report and sometimes shares the written tasks among its members, although as previously mentioned, these are usually farmed out to an external writer, such as a science journalist. Alternatively, the organising project manager writes the report on behalf of the group. The group can also opt to outsource other concrete tasks to specialists with the necessary professional competences - for example, in connection with factual information gathering, data overview, etc. Sometimes the interdisciplinary work group forms sub groups carrying out scientific research, modelling work etc.

During the first phase of the project, the work group prepares a preliminary report which may contain initial assessments along with proposed courses of action. To ensure that the final report is based on the best possible professional foundation, the organiser holds a midway seminar. Between 20 and 25 scientific experts and stakeholders parties are invited to comment on the group's preliminary report and put forward suggested amendments. The participants cover the (cross) disciplinary angles of the project so that all important aspects can be discussed at the seminar. The aim of the seminar is to clarify the technical foundation and for this reason, political debate takes a back seat. Possible technical and political solutions are also discussed. Typically, the seminar will consist of presentations by work group members and debate – partly in a plenum and partly in groups when dealing with the more specific topics. Individual members are often appointed to oppose selected parts of the report.

The seminar provides the work group with useful input about amendments and improvements to their report, and the group decides how best to use these suggestions in its work. In this way, the group's preliminary findings and action proposals are "tested" by other experts and interested parties. Armed with this input, the work group prepares the final report containing the group's assessments and recommendations. Before

	from the group's s that have been dov references, etc. As a final phase,	publishing, the report may be sent for a final round of comments from selected specialists, e.g. participar from the group's seminar who consider possible factual errors and omissions, significant oversights or aspect that have been downplayed, the need for the updating of data in the event of new data or further data, furth references, etc.  As a final phase, the group can hold a briefing session at which it presents its assessments a recommendations to the parliamentary committee covering the field.						
	be an arduous pro- effect in the subse	cess, but in do equent politica	oing so t al proce	the group ensures that ss and in relation to of	ntific foundation and act its messages will achiev her decision-makers. In s but consensus is still th	e a greater penetrative some occasions it can

Results and products of the method application	The aim is for the group to reach a consensus as regards the technical foundation and action proposals. This may be an arduous process, but in doing so the group ensures that its messages will achieve a greater penetrative effect in the subsequent political process and in relation to other decision-makers.  Often the recommendations outlined by the group are directed at MPs, councils and municipalities, but other key decision-makers may also be the target of the group's work.  Direct results  The method ends with a report that can be sent to relevant players and to MPs. The report contains an interdisciplinary assessment of the topic and robust, holistic recommendations for future action delivered by the central players in the field.  Indirect results  The method can often help to create (renewed) debate about a given topic. In the work group, experts work together across disciplines and with colleagues with whom they have not worked before. The midway seminar and the final conference often leads to new lasting collaborative networks and can thus help to support continued development in the area.

Specific <b>strengths and weaknesses</b> of the method vis-à- vis the challenge(s) addressed	etc. normally sepa order to analyse the recommendations Weakness: The g Secretariat or a ch chaos". The meth stakeholders may	trength: The method facilitates a holistic approach to the problem by making stakeholders, scientific experted. normally separated by interests, sectional, institutional or disciplinary divisions meet and collaborate order to analyse the problem and reach a common set of political recommendations. This results in very robuse ecommendations and sheds light over agreements and disagreements within the field.  Veakness: The group members have to take responsibility for the whole process, because there is not eccretariat or a chairman carrying out the work for them. Therefore, the group will often work "on the edge haos". The method requires very good facilitation and moderation skills. If the moderator is weak, certa takeholders may dominate the work of the group and the facilitator might tend to take the role as chairman

	Event organisation skills	on	Х				
	Project management skil Other skills:	lls			Х		
What are the issues of concern that organisers need to take into account when applying the method?	One typical obstacle to the work of the group is when the group members stay "too" loyal towards their organisational interests and refuse to discuss potential compromises. The first meetings are often characterised by 'position struggles', where the members refuse to work together in order to develop a common understanding of the problem.						
	This is not necessarily a negative starting point, but it requires a strong facilitator being able to constreminding the members that when stepping into the group they agreed on trying to collaborate a developing new ideas, not only reproducing existing not inter-linkable interests. They are obliged to cre usable product. The individual members cannot just withdraw from the work because they disagree with group members. The organiser must throughout the process keep the focus on making the members list each other and decide when disagreements between the members are so big that they cannot be solved therefore have to be let out of the work. Throughout the process a 'peeling' of the focus of the work group therefore take place.

**32.** Integrated Assessment Focus Groups, Participatory Integrated Assessment (PIA) with computer models (This method is related to Focus Groups \*, Participatory Modelling and Serious Gaming \*)

This method is related to Focus Groups \*, Participatory Modelling and Serious Gaming \*

\* See the related factsheets

Short description of the method

Focus groups are useful for gaining insight into various viewpoints on issues. In Integrated Assessment Focus Groups, separate sessions are organised where participants interact with computer models to gain insight into the effects of interventions on complex systems. The use of computer models during a focus group has certain advantages. These Integrated Assessment models serve as tools for analysing complex issues, such as climate change, together with citizens.

Long description of the method

Focus groups are useful for gaining insight into various viewpoints on issues. This has been described in detail in a separate fact sheet. In Integrated Assessment Focus Groups, separate sessions are organised where participants interact with computer models to gain insight into the effects of interventions on complex systems. The use of Integrated Assessment (IA) models during a focus group has certain advantages. These models serve as tools for analysing complex issues by including expert input. This is given both in face-to-face interaction, and by inviting the participants to interact with scientific models with a user-friendly computer interface. The participants get a feeling for the effects of all types of interventions in complex systems, and the potential results are predicted by underlying numerical models. This has been described in detail in the chapter 'Citizen interaction with computer models' (Dahinden et al., 2003). When looking at climate change models four complexity dimensions are recognised:

- Spatial there are links between local activities and global influences and vice versa;
- Temporal there are both short term and long term perspectives which are very relevant;
- Uncertainties in the assumptions on cause and effect in the systems;
- Policies of different entities across the world which influence the system strongly.

The use of IA models helps to cope with these complexities simultaneously. When building the models knowledge from various disciplines is integrated and is used to predict cause and effect of a large number of variables.

A lot of work on the Integrated Assessment Focus Group has been specifically designed for climate change, so that will be the primary focus here, but the method can be also applied in other areas.

# IA Focus Group Phase 1 Participants' spontaneous feelings about climate change Participants' collages IA Focus Group Phase 2 Expert Input Computer models IA Focus Group Phase 3 Synthesis of informed participants' conclusions Citizens' roports

### Process

The three main steps in the series of events called the Integrated Assessment Focus Group, from

'Citizen participation in sustainability assessments' (Kasemir et al. 2003) are:

- 1. Gathering the participants opinions about climate change;
- 2. Expert input, including the use of computer models;
- 3. Synthesis, including a reflection on the credibility of the results of the model.

The first and third steps are similar to the steps taken in a Focus Group. The computer models are presented by an expert and are followed by participants' interaction with the models. Preferably, there is direct access – so people can touch the buttons themselves. In the ULYSSES project there were a number of variations. For example two separate models were used, one with an emphasis on a global perspective and the other on more local systems. Due to the complexity of the models, and interfaces in some sessions, there was an expert directly involved in helping the participants use the systems.

Objective	of	application	of	the
method				

 $\square$  Policy formulation  $\square$  Programme development  $\square$  Project definition  $\boxtimes$  Research activity  $\square$  Others:

Results and products of the method application

Focus groups as a research activity can lead to policy recommendations. According to Kasemir (2003) 'a crucial feature of IA Focus Groups is that they explore the border between private decision-making and public debates' (page 20).

The models can support discussion on complex issues by providing new information and insights. So they also facilitate learning with the participants. In many cases the developers of the model have been involved and the experiences in the sessions have been used to further develop the models.

What are the issues of concern that organisers need to take into account when applying the method? Three issues raised by Dahinden (2003) for models used in these sessions:

- 1. user-friendly;
  - If a model has not been designed for lay people it will be necessary to offer continual technical assistance.
- 2. transparency;

Participants learn more from systems which reveal some of the intermediate results and allow users to understand relationships between variables.

3. credibility;

For the process to have results, the users need to trust the models and the experts supporting the process.

**Integrated assessment modelling** is a type of scientific modelling that is increasingly common in the environmental sciences and environmental policy analysis. The modelling is integrated because environmental problems do not respect the borders between academic disciplines. Integrated assessment models therefore integrate knowledge from two or more domains into a single framework. Integrated modelling is referred to as assessment because the activity aims to generate useful information for policy making, rather than to advance knowledge for knowledge's sake. Integrated assessment modelling is that part of integrated assessment that relies on the use of numerical models.

Integrated assessment modelling has a long history, and scholars disagree on the first precedent. However, it became recognizable as a sub- or inter-discipline in the late 1980s with a focus on understanding and regulating acidification. Integrated assessment modelling was further developed in the area of climate change, inter alia in the context of the Energy Modeling Forum.

Notable centres of integrated assessment modelling are IIASA, MIT, RIVM and International Futures. Notable scholars are Bill Nordhaus, Robert Mendelsohn, Rich Richels, Michael Schlesinger, Stephen Schneider, Richard Tol, John Weyant, and Gary Yohe.

## Sources (names of interviewees, links to relevant websites, etc.)

Some further reading on participatory modelling, not necessarily in the context of focus groups:

Natalie A Jones, Pascal Perez. "Evaluating participatory modeling: developing a framework for cross-case analysis." Environmental management 44, nr. 6 (2009): 1180–95. doi:10.1007/s00267-009-9391-8.

### The Quintel model

There are a number of models at both a global and regional scale in the energy sector. One example is the Energietransitiemodel that was originally built by Quintel with funding by GasTerra B.V.

The model has a number of different versions:

- A model of the Dutch energy system which has been used in a number of settings:
  - TV program: http://www.wattnu.nl/;
  - in depth interviews with professionals (see link below);
  - focus group type setting / workshops;
- a table top interactive game for discussions at events;
- a game about energy at home.

"Energy Transition Model - Scenario by Jako Jellema." Accessed August 1, 2014. <a href="http://beta.et-model.com/presets/jellema">http://beta.et-model.com/presets/jellema</a>.

There have been some discussions about transparency and credibility of the model. The model has been made open source and has been validated by a number of partner organisations.

Long description of the method	Interviews are used to explore the views, experiences, beliefs and motivations of individuals on specific matters. Interviews as a qualitative method are believed to provide a more in-depth understanding of a certain topic than would be obtained from purely quantitative methods (for example questionnaires). Interviews are, therefore, most appropriate where: i) little is known about the phenomenon under investigation; and ii) detailed insights are required from individual participants. In addition, they are appropriate for exploring sensitive topics, where participants may not want to talk about such issues in a group environment.  There are 3 fundamental types of research interviews. These are:  1. Structured interviews – a list of predetermined questions are asked. There is little or no variation in the questions. There is no scope for follow-up questions to responses. This type of interview is quick and easy to conduct. However, it is hard to collect deep answers through structured interviews.  2. Semi-structured – it consists of several key questions that help to define the areas to be explored, but also allows the interviewer or interviewee to diverge from the list of predetermined questions in order to explore an idea or response in more detail. It allows for the elaboration of the topic.  3. Unstructured – this interview typically starts with an open question and then develops according to the response given. It can be difficult to manage, and to participate in, as the lack of predetermined interview questions provides little guidance on what to talk about which many participants find confusing and unhelpful. However, being the most explorative type, unstructured interviews might

# What are the issues of concern that organisers need to take into account when applying the method?

- Can the question be easily understood?
- Is the question biased?
- Will interviewees be willing to provide the information?
- Is the question applicable to all interviewees?
- Does the question allow interviewees to offer their opinions/expand on basic answers?
- Are follow up questions likely to be required?
- Will it be straightforward to analyse?

When considering face-to-face vs. telephone interviews, it should be kept in mind that telephone interviews are less suitable for exploring complex topics or the attitudes of the interviewee.

Additional information of relevance (such as historical background, where the method has already been applied, etc.)

Some advantages of the telephone/Skype interview vs. the personal interview include: i) no matter what the geographical location of the interviewee – he/she can be reached rather inexpensively; ii) representativeness can be achieved, as a higher number of people can be reached as it is inexpensive and time-saving. Yet, telephone interviews are less suitable for exploring complex topics or the attitudes of the interviewee.

## Name of the engagement method (alias)

### 34. Knowledge Atelier

(in Dutch: Kenniswerkplaats)

- \* Similar and related to:
  - Science Shops / Civil Society Driven Research (See separate factsheet)
  - Community-Based Participatory Research or Community-Based Research (See separate factsheet)
  - Participatory Action Research (See separate factsheet)

Short description of the method

A kenniswerkplaats (knowledge atelier) is a network of regional authorities, business, civil society organisations and education institutes aiming to strengthen a region's competitiveness through innovation by collaboration. Research on particular questions related to the specific region's development is done as part of regional development plans, by students in their curriculum. This method provides an infrastructure for doing participatory action research and learning to contribute to regional development.

Long description of the method

The goal is to strengthen the region's competitiveness through innovation. Innovation is achieved by collaboration; regional development, sharing and valorising knowledge are important aspects of each Kenniswerkplaats.

The method requires cooperation between regional authorities, business, civil society organisations, and education institutes. Research is done as part of regional development plans by students in their curriculum.

The kenniswerkplaats contributes to answering regional questions and creating new partnerships. By working together with students, organisations meet potential new employees and gain new ideas. Regional development, sharing and valorising knowledge are important aspects of each Kenniswerkplaats.

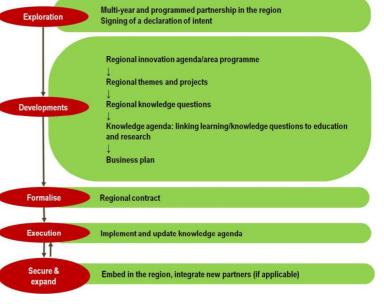

The regional actors typically involved in kenniswerkplaats, both in agenda setting and funding, are:

- Local and regional authorities: provinces, municipalities and water boards;- Businesses/ Entrepreneurs: Chambers of Commerce, Small and Medium-Sized Enterprises (SMEs), , consultancy offices, Syntens (Ministry of Economic Affairs Consultants for SMEs) and Greenports (the clusters of Dutch horticulture stakeholders);- Non-profit organisations, including: welfare organisations, interest organisations, foundations and associations.

Costs are shared among regional authorities, business and education institutes (in some cases, e.g. InterREG, subsidies were used as well). Each region has a co-ordinator. Foorthuis  $et\ a^{S}$  describe the Kenniswerkplaats as follows:

"Kenniswerkplaats is a place of innovation. On the one hand, a highly streamlined and controlled knowledge infrastructure, and on the other, an open research centre for the SME segment. And yet, at the same time, a workshop and meeting place for students, teachers, researchers, public officials, entrepreneurs and the public. Anyone in the region with a knowledge question (or better still, a learning question) can come here for answers. The questions may come from a wide variety of areas: sustainability, social-economic development, spatial issues or innovation. Anything goes, so long as the region determines and establishes the focus. The region,

rather than the knowledge institution, has the initiative. The Kenniswerkplaats realisations in the Netherlands (now numbering eight) have a permanent staff.[...] This is the way to create a national infrastructure. From within regional innovative knowledge agendas, work is being done on projects and processes for competency development, and in these the educational and research seaments are working together in close partnership. This creates not only a reaional but a national knowledge agenda that facilitates coordination. Through this. Kenniswerkplaats offers new inroads. from

	intermediate vocational education level through to university, for regional and area-oriented resections and support of the small and from concrete to abstract. At this point we have also seen that the acceptance of the support of							
	Sheet). The Science Kenniswerkplaats of because of its focus	The Kenniswerkplaats has similarities to the Science Shop (Civil Society Driven Research, see separate Fact Sheet). The Science Shop provides an option to have research done for civil society organisations. The Kenniswerkplaats offers less diversity in research questions being taken in, but can go much more in-depth because of its focus. Also, more stakeholders are involved over a longer period; research is not done for a single stakeholder. Kenniswerkplaats and Science Shops are thus quite complementary and their close contacts guarantee syngray.						
Objective of application of the method	☐ Policy formulation	on V Programme dev	elopment V Project de	finition V Research ac	tivity   Others:			
Results and products of the method application	Nine Dutch regions have a Kenniswerkplaats, which published many studies on issues of regional concern.  "In each Kenniswerkplaats, three traditional universities, eleven universities of applied sciences and nine intermediate vocational education institutions invested a total of 126,580 student hours in the 2010-2012 period. An additional 26,000 teaching hours and 321 researcher hours went into projects, which also included the involvement of 612 enterprises and almost 600 individual citizens. Thanks to these efforts, for the 2012-2013 period each Kenniswerkplaats is strived for a commitment of 100,000 student hours per Kenniswerkplaats. This demands a dynamic and reliable infrastructure connecting knowledge institutions and the 'real world'."  (Foorthuis et al., ibid)  Some example results from the Peat Colonies Kenniswerkplaats, are <sup>6</sup> :  - Mathematical model to compare different types of renewable energy;  - Feasibility study of alternative forms of energy supply;  - A multi-touch table was developed, to advance imagination in spatial planning of energy supply;  - Research on the reinvention of a district;  - An investigation into the Albrecht method (fertilization);  - Project Proleaf to get more value from beet-leaves;  - Research on yield increase of the main local crops;  - Investigation of the possibilities of growing protein rich crops for animal feed production on the farm or for regional markets.

Name of the engagement method (alias)	36. Multi Criteria D	ecision Analysis (MCD	PA)			
Short description of the method	MCDA is a tool that can be applied to complex decision making processes. MCDA techniques can be used to identify a single most preferred option, to rank options, to short-list a limited number of options for subsequend detailed appraisal, or simply to distinguish acceptable from unacceptable possibilities.					
Long description of the method	MCDA is both an approach and a set of techniques, with the goal of ordering a set of options from the most preferred to the least preferred option. There is usually a conflict or trade-off involved in options and no one option will be best in achieving all objectives. Costs and benefits usually conflict in addition to short and long term benefits.					
	MCDA is a way of looking at complex problems which might be characterised by a mixture of monetary and non-monetary objectives. It aims to break the problem up into manageable pieces to allow data judgements to be made, and then reassembling the pieces to form an overall coherent picture to present to policy makers. The purpose is to aid thinking about the problem, not solve the problem.

What are the issues of concern that organisers need to take into account when applying the method?

A MCDA carried out very early in the life of a new project can usefully guide the search for further information, since the first attempt at modelling will highlight many inadequacies in identifying and defining options and criteria, as well as judging trade-offs.

MCDA is likely to contribute to the decision-making process, i.e. the first answer might not necessarily support a decision.

MCDA is a socio-technical process. The technical tools are only part of the process and designing the social process within which the technical modelling will take place is crucial to the process.

The MCDA process should be done iteratively and every input might not be correct on the first attempt. Organisers should draw on participants' judgements, even if they are not sure, to help them with the process.

Other key issues include: who defines the initial criteria; what alternatives are available to the decision-maker; and how the different criteria are translated into a numerical score in order to rank the different alternatives.

Name of the engagement method (alias)	37. Neo-Socratic Dialogue (NSD)				
Short description of the method	Neo-Socratic Dialogue (NSD) is a method for resolving ethical questions as a means of discussing ethical problems with the respective stakeholders. The method makes an inquiry into ideas aiming to establish consensus on a given topic through joint deliberation and the weighing of arguments.				
Long description of the method	NSD typically starts with a general question. The questions (usually drawn from ethics, politics, epistemology, mathematics and psychology), are of a general and fundamental nature. They should concern basic, essential issues and should be answerable by thinking without prior training needed. The question should be formulated in a way that is understandable, allowing the participants to find relevant examples from their everyday life.  Initially, each participant of the group proposes a relevant case study. Participants are provided with criteria to help select suitable cases. One of the case studies is chosen for further investigation and discussion. Relevant questions to ask during the discussions are: What kinds of views were presented? What were the reasons of the different views? What kinds of principles and values were revealed? Were there any conflicts among them? What consensus and answers were elucidated?  The common objective is to reach consensus, not as an aim in itself, but as a means to deepen the investigation. The method implies a systematic investigation of viewpoints, assumptions and reasons.  Participants: minimum 5 to maximum 15 people from diverse backgrounds. No prior philosophical training is needed.  Facilitating: the facilitator can write the main points on a flip chart; a transcriber writes down participants statements on a computer; the discussions can be recorded on an IC recorder with the participants' agreement to supplement these documents.  The phases of NSD:     A general question must be formulated.  The participants give concrete examples from their personal experience in which the question of discussion plays a key role.  The group selects one example (case study), which is the basis of analysis and argumentation throughout the discussion.				
	the discussion.  During the Neo-Socratic Dialogue, the participants examine the validity of judgments step by step. Judgments represent standpoints. Examining the backing rules means examining the reasons given for the judgment. Uncovering the principles and values means looking for the reasons behind the rule(s). The Neo-Socratic Dialogues aims to discover the backing rules and test the validity of rules and principles related to the particular case study.				
Objective of application of the method	☐ Policy formulation ☐ Programme development ☐ Project definition ☑ Research activity ☐ Others:				
Results and products of the method application	- Explore the rules and principles of given case studies; - Reach consensus in regard to the rules and principles underlying a thematic case study; - Encourage consent among participants through deep investigation of their principles and values.

Additional information of relevance (such as historical background, where the method has already been applied, etc.)	This method was formulated by Leonard Nelson (1882–1927). It is presently used in Germany, England, and Holland in philosophical training, dialogue-based education, problem discovery, and for establishing consensus. Recent attempts have been made to apply the method to ethical and social discussions in the medical and healthcare fields. The method is often used in education and consultancy.

Name of the engagement method (alias)	38. Open Space Technology
Short description of the method	The Open Space Technology is a method to organize participation events basically of large and medium scale (although events of 5 to 1000 and more participants have been reported yet within the OST-community). The method is based on the principles of passion, responsibility and commitment, bearing in mind the assumption that the most productive way to work is to work on a topic for which one cares.
Long description of the method	A one day Open Space event has three parts: i) An introduction to the whole plenum, explaining the method and what is expected of the participants in order to have a successful event. It is followed by the agenda setting, where workshop sessions are announced and scheduled and where the participants register for the workshops of their choice (It all takes a maximum of 1 hour – 15min for the introduction and the rest of the time is dedicated to agenda setting and enlisting). ii) The sessions themselves, where multiple workshops are conducted simultaneously. iii) A final round with the whole plenum in which the facilitator summarizes the events of the day and gives participants the opportunity to comment on their experiences and lessons learned.
	Rules: In the introduction, the facilitator should explain clearly how the event is going to work. The method's originator Harris Owen offers four principles and one law as framework rules for an Open Space event: P1) "Whoever comes is the right people.": Especially important at stakeholder events with a broad scope of participating organizations, or where differences in status and hierarchic position may occur. P2) "Whatever happens is the only thing that could have happened.": Sometimes the expectations of the participants differ from what the event is really like, be it the event in general or discussion dynamics. P3) "Whenever it starts is the right time." & P4) "When it is over, it is over.": These two principles concern the productive time spent in a workshop session. When there is nothing worthwhile to discuss anymore, it is better to close the workshop and join another one or have a break instead of clinging on the scheduled 90 minutes.
	This leads to the "Law of two feet" which says that you are allowed to switch workshops within an ongoing session or separate for a more intense discussion in a smaller group or even a break. If a participant feels, he or she is neither able to learn nor to contribute something to the discussion, or the discussion turns into a direction which is of no interest for him or her, he or she should not waste time and leave the workshop and go to another one which he or she finds more interesting. Neither should the left group feel offended about this nor the person who left have a guilty conscience.  Additionally, it is a possibility to avoid or leave workshops where a single person dictates the discussion dynamics, issues and accepted facts without paying regard to the opinions of the others.
	Agenda setting: After explaining the general rules, the facilitator describes the agenda setting process. The participants are bid to approach the table in the middle, write down on the provided sheets the title of the workshop(s) they want to convene, introduce themselves shortly (!) via microphone, announce the workshop

The participants are bid to approach the table in the middle, write down on the provided sheets the title of the workshop(s) they want to convene, introduce themselves shortly (!) via microphone, announce the workshop and afterwards pin it on a free timeslot of their choice on the bulletin board. To run the agenda setting more smoothly, the board should be divided in session columns, for example 'morning', 'midday' and 'afternoon', and provide post-its with a space number and a timeframe to attach to the workshop sheets. The participants do not have to wait till one of them is finished with his announcement in the middle of the circle; in fact, to achieve a more dynamic process, they should be encouraged to write their own workshops down, while another one is announced. The participants are allowed to convene several workshops but they are not obliged to convene at least one. They can simply participate in the proposed ones.

After the bulletin board is filled with workshop sheets, the so called 'market place' is opened by the facilitator, in which all participants are free to enlist in any workshop of their interest by writing their name on the workshop sheet on the board. The participants are free to trade slots, if, for example, the convener wants to attend another workshop in the same timeframe, to merge workshops, if they address the same issues or to split groups (with or without defining the workshop title more precisely), if the number of participants is too high to have an intense discussion. It is possible to set participant limits beforehand. One or two staff members should be present to answer questions.

#### Workshop sessions:

After completing the agenda setting, the participants should commence immediately with the workshops themselves and gather at the announced spaces. The spaces should be equipped with pencils and paper to note down the discussions and results and maybe a flipchart to give the opportunity to support the discussion with visualizations.

After the end of the last workshop follows a final plenum session in which the facilitator summarizes the events of the day and gives the participants the opportunity to comment on their experiences and lessons learned.

	Follow up:  A book of proceedings should be sent to the participants only a few days after the event. It is a summary of the outputs of all workshop sessions with a short overview evaluation. Then the gathered data can be analyzed more closely to produce a report fitting to the objectives of the project/funder/
	Duration:  The duration of the event has an influence on what can be achieved. A single day event can produce a lot of information and data, lead to intense discussions, information translation between stakeholders, networking and ideas for new projects or other follow up actions. A two day event allows better recording and the opportunity to convene new workshops which have developed out of the discussion process and dynamics of the first day (e.g. the planning of a new proposal/project or issues which arose in one workshop and could not be discussed completely). Additionally, a three day event allows more time for reflection. What is more it is possible to make a book of proceedings till the end of the third day and give it as a take home gift for the participants (in this case without an evaluation). In a two or three day event there should be a news session in the morning and in the afternoon to summarize what has been achieved before and announce new workshops or shifts in the agenda.
	<b>Recruiting:</b> Despite the principle of voluntary self-selection, the people/homepages/distribution lists, etc. to which the invitation is send should be chosen accordingly to the objectives of the event. For example, making sure that every stakeholder is represented sufficiently.

Short description of the method			m which covers a variety priorities and economic s		elegate power or	
Long description of the method	Participatory budgeting (PB) involves citizens directly in making decisions about budget issues and priorities. This can take place on a small scale at the service or neighbourhood level, or it can be done at the city or state level. PB is not traditionally used in science; however, as participation moves into research funding, it may become more common.  PB can be run as a one-off process, but long-term benefits such as social capital and ownership, require a reoccurring, cyclical process. Discussions are often limited to new investments rather than discussing spending as a whole. Participatory budgeting can deliver increased transparency and re-establish the legitimacy of government budget decisions. It has also been shown to build the skills and awareness of participants through the process of deliberation.					
			ut under the banner of p mmunity projects and oth		g. This allows a group of	
	The total number of participants in all meetings in city-wide processes can be tens of thousands (see example PB in Puerto Alegre). In Europe and North America the numbers have tended to be more modest, the hundreds at most. The scale of citizen participation has ranged from single neighbourhoods, to an ent state (with a population of millions).					
	Participatory budgeting can be done with direct participation of citizens or through directly elected citizen representatives. The larger, city wide processes often combine the two with direct participation at neighbourhood level where representatives are elected for city wide forums (Smith 2009).					
	There is no universinclude:	sal way of applying p	articipatory budgeting. <sup>-</sup>	The main features of	participatory budgeting

	Though each experience is different, most follow a similar basic process. Residents brainstorm spending ideas, volunteer budget delegates develop proposals based on these ideas, residents vote on proposals, and the government implements the top projects. For example, if community members identify recreation spaces as a priority, their delegates might develop a proposal for basketball court renovations. The residents would then vote on this and other proposals, and if they approve the basketball court, the city pays to renovate it.

#### 40. Participatory Design

(Co-design and practice-based research)

Including various other tools:

- Consultation;
- Workshops;
- Design Workbooks (interaction design, research through design, ideation).

#### \*This method is related to:

- Citizen Science (See separate factsheet)
- Participatory Action Research (See separate factsheet)
- Charrette (See separate factsheet)
- Participatory Mapping (See separate factsheet)

#### Short description of the method

Participatory design can be done together with citizens concerned about a certain issue (e.g. the environment). The starting point is consultation with individuals and community organisations. This is followed by an interactive design process which includes field tests with the users of the developed technologies and devices.

#### Long description of the method

Participatory design can be done together with citizens concerned with a certain issue (e.g. the environment). The starting point is consultation with individuals and community organisations. This is followed by an interactive design process which includes field tests with the users of the developed technologies and devices.

Designing for users is a common practice in the field of industrial design. The user is also seen as a customer and the future buyer of the product. Participatory design with citizens who are, for instance, concerned with their local and global environment, has a different approach. There are a number of interesting projects which are pioneers in the area of participatory design.

An example of participatory design is the Energy and Co-Designing Communities (ECDC) project<sup>7</sup>. They "work with existing communities engaged in reducing energy demand, to understand the range of perspectives and knowledge they embody". The project's website says about the uniqueness of their approach: "While many researchers approach such questions, this is typically from the traditional perspective of mapping what people do and think in the context of 'useful' technologies. Obviously, this is very important, but we are interested in getting at what is often neglected in such studies: the imaginative, playful, emotional and potential aspects of people's use of technologies. [...]

The aim is to engender creative discussion and debate around matters of trust, responsibility and community ownership of energy demand reduction."<sup>8</sup>

ECDC is funded as part of RCUK's Energy Program, which studies ways for the UK to reduce its carbon emissions with 80% by 2050.

A presentation on the project can be seen here: <a href="https://www.youtube.com/watch?v=ttwV">https://www.youtube.com/watch?v=ttwV</a> tQWszg

#### Process

The ECDC project uses materials drawn from field trips, workshops and probes, with which they "will design novel devices and give them to participating communities to test in their own settings."

The process used in the ECDC can be summarized as follows:

- Workshop with communities (citizens engaged in a certain issue), academics & local government, including:
  - Collaborative mapping sessions;
  - Probes and workbooks to feed the discussion;
- 2. Fieldwork;
- 3. Design & adaptation during deployment.

<sup>&</sup>lt;sup>7</sup>www.ecdc.ac.uk – see the pages 'background' and 'process'

<sup>8</sup>http://research.gold.ac.uk/4782/1/ecdc\_poster\_4.pdf

ECDC - "The energy community workshop held at the GeffryeMuseum in London, July 2011"

Probes and Workbooks<sup>9</sup>:

Probes given to participants, they are drawn on and written into, capture material that is used for making design proposals

The ECDC website explains probes: Each pack contained a series of evocative tasks related to energy consumption: writing an obituary for an electric appliance, confessing an energy usage guilty secret, taking a picture of something that should go faster.

The Probe Packs will allow us to gather different insights on energy and community practices. Some tasks might seem vague and unconventional, but it is through this ambiguity that we are hoping to elicit inspirational responses. The probes are open to interpretation. Our volunteers can decide how to respond to each task, some probes might provoke while others might remain ignored. This diversity of reactions will enrich our views on energy and communities.

The workbook is used to suggest separate themes or directions for design by presenting on each page a mix of comments, images and a title.

How workbooks work is described here: http://www.ecdc.ac.uk/wp-content/uploads/2011/06/workbooks.pdf

Objective of application of the method

□ Policy formulation □ Programme development ☒ Project definition ☒ Research activity □ Others:

Results and products of the method application

There seems to be no evaluation report of the impact of the example project.

The example project ECDC led to a device called the Energy Babble, which is "something like an internet radio appliance, designed for domestic and public spaces and dedicated to the topic of energy demand reduction. The devices are networked, drawing content from online sources and allowing responses using a built-in microphone.

<sup>&</sup>lt;sup>9</sup>EnergiseHastings. "Energy babble-energise-hastings-sm". http://www.slideshare.net/EnergiseHastings/energy-babbleenergisehastingssm

Presenting a mixed and sometimes humorous polyphony of energy-related content, the intention is to expose the variety of discourses around environmental issues and to invite listeners to take part within it". <sup>10</sup> It has a speaker, a (glass) megaphone, and a microphone. It thus connects communities and allows awareness raising in other places (e.g. museums, public spaces).

The Energy Babble at home <a href="http://www.ecdc.ac.uk/2013/09/30/deploying-at-home/">http://www.ecdc.ac.uk/2013/09/30/deploying-at-home/</a>

\*This method is related to Citizen Science (See separate factsheet)

#### Short description of the method

Participatory sensing projects involve volunteers in the gathering of data for research. This process is facilitated with ICT platforms which often include the use of handheld devices such as smartphones. This is one of the methods which is used within various forms of Citizen Science.

#### Long description of the method

#### **Background**

Data collection is a fundamental part of many natural sciences and can be an expensive component of research projects. Historically, there are interesting examples of involving citizens and lay experts in these processes. In some cases biologists have recruited participants in their data gathering campaigns for over 100 years. This has been done in the Audubon Society's Christmas Bird Count, which claims to be the longest running citizen science survey in the world. In the last decade, the participation in data collection has become easier due to developments in information and communication technologies. This has become an important factor for making the gathering of data cheaper and also for facilitating the communication with volunteers during the recruitment, data collection and in the data analysis phase.

#### **Roles of participation**

The core activity of the volunteers in the project is the gathering of data, usually at a specific location and sometimes also at a specific time. The platform needs to facilitate the easy submission of data to a central location. Other possible roles of citizens can be in analyzing the data. Sometimes this only concerns their own data but it can also relate to the whole dataset or a subset in which they are personally interested. There are also examples of projects where Civil Society Organizations are involved in the project definition of a project and also involve their own members in the execution. In general there are often benefits for the volunteers, which can be in the form of increased knowledge of the subject matter.

#### Infrastructure and tools

There are large variations among the types of participatory sensing projects. An important distinction is to what extent at the start of the project the tools are already available for the data collection. In some projects the tools have been developed from scratch and subsequent projects have a much shorter lead time and lower investment of time and money. For example, the tools developed in the original NoiseTube project in Paris have been published with an open source license and other parties are encouraged to organize their own participatory noise mapping projects with the open framework.

#### Participatory design of sensing instruments

The identification of <u>which</u> issues to address, and <u>which</u> sensing instruments to apply, can be done in a participatory way as well. An example can be found in the EU funded project Citizen Sense:

"The Citizen Sense project is both research and practice-based, and undertakes a review of existing practices and technologies while also testing, modifying and further developing sensing kits for use by participants. We undertake a participatory design process, where with participants and community groups we collaboratively develop concerns to be monitored, as well as sites, technologies and practices for monitoring. We do this through initial consultation, walking seminars where the kit is deployed and tested, interim site visits, as well as a follow-up workshop." Project leader Jennifer Gabrys of Goldsmiths, University of London – Engage2020 survey (2014).

This way, participatory sensing is undertaken using compete collaboration in all aspects of the method.

What are the issues of concern that organisers need to take into account when applying the method?

#### Motivations for participation

Keeping volunteers connected and active in the project has proven to be an obstacle for some projects. There are various motivations for participating in scientific research. Often within one project there can also be multiple motivators which vary across the 'crowd' of volunteers which contribute to a crowd sourcing project. In the MinderGas project (aimed at reducing natural gas use in households), for example, the primary motivator is for users of home energy systems to gain insight into their own energy use. The platform facilitates this feedback but simultaneously serves as a platform for aggregating the data and creating new value. In the EnergySense Living Lab, the following picture summarizes the fundamental point of there being some form of feedback to the contributors of the data. In this case, the data is generated by households, aggregated and processed in an ICT platform and the results are used for, among other things, scientific research, services development, and feedback to the participant households.

#### Confidentiality and security

The participation of volunteers in data collection with electronic systems will often include data which relates directly to the personal lives of the citizens involved. For example, in the projects linked to InfluenzaNet, people register factors related to their health as well as the area in which they work and live. There needs to be a system for protecting confidential information. Sometimes anonymizing the data will be sufficient, but often the data includes location and time information which can easily be related to specific users of the system. Various solutions are available to organize access and accountability to confidential information to protect volunteers and to comply with the relevant privacy legislation.

### **Expectations management**

Expectations management is important. For example, in the iSpex project, participants thought they were monitoring particulate matter at street level, but in reality the measurements were taken through the whole atmospheric column to which their sensor was pointed, including higher layers. The results were thus not directly relevant to them, but more of interest to researchers.

Name of the engagement method (alias)	43. Perspective Workshop
Short description of the method	The purpose of this SWOT-inspired workshop method is to explore possible myths, generate new perspectives, and put forward guidelines on a given technology or technological development. The method is especially applicable for slightly broader technological topics with no prior consensus.
Long description of the method	The purpose of this SWOT-inspired workshop method is to explore possible myths, generate new perspectives, and put forward guidelines on a given technology or technological development. The method is especially applicable for slightly broader technological topics with no prior consensus.
	The perspective workshop is a technology assessment method. It involves people who are affected by the technology. As a point of departure, the method uses the SWOT-analysis. SWOT stands for <i>strengths</i> , weaknesses, opportunities and threats.
	The perspective workshop comprises 36-48 participants, and normally lasts one and a half day. The idea behind this method is that the programme and the tasks are completely set, whereas the end result is open. Contrary to other workshop models, the perspective workshop doesn't only focus on local actions. The participants' perspectives can be directed to all levels; i.e. from micro to macro and local to international.
	Before the workshop  The organiser appoints an external planning group which comprises a number of people with specialist knowledge on the workshop topic. This group's primary task is to qualify the content and process of the workshop. Based on the planning group's guidance, 12 articles are written. These articles present possibilities and threats regarding the topic. Participants are carefully selected, and they are asked to read the articles and prepare a home assignment. The group should involve relevant CSOs and stakeholders regarding the topic of the Perspective Workshop to secure a broad focus on the issues at stake.
	During the workshop  The workshop combines group work and plenary sessions. Participants are divided into groups of 6-8 people, and after each round, the groups present their results in plenum. A process consultant is responsible for facilitating the workshop. The workshop is divided into four rounds:
	1) The present situation: Starting from their own experience, participants describe the current situation and problems posed by the technology or technological development in question. This description can list both positive and negative aspects.
	2) Consequences: In this round, participants discuss the possible consequences of the technology. This consequence analysis is carried out on the basis of the 12 articles, and the presented possibilities and threats are evaluated against participants' description of the present situation.
	3) The future scenario: In the third round, participants imagine what the future will look like. On the basis of the results from the previous rounds and their imagination, they produce positive and negative future scenarios on the topic. After the groups have presented their results, the scenarios are divided into themes. The participants choose the theme that they have an interest in, and thus, new groups are formed.
	4) Perspectives: The fourth and final round is action-oriented. The participants produce their own perspectives for moving from the present situation to the hoped-for future. Participants discuss the perspectives for future action necessary to achieve the desired development. All in all, the workshop ends with drafting an action proposal composed of participants' perspectives.
	After the workshop  This method doesn't end after the fourth round. The organiser plays an important role in disseminating the results of the workshop (for more on this, see below).
Objective of application of the method	☑ Policy formulation ☑ Programme development ☐ Project definition ☐ Research activity ☐ Others:

Results and products of the method application	All projects have been concluded with a final report in which workshop results have been published. In the process of disseminating the results, the organisers have carried out different debate-generating activities which are a very important feature in regard to this method. Direct results of these activities include among other things the following:							
		The project <i>IT and working conditions</i> had articles published in trade unions' member's magazines, and takeholder organisations acted on the results of the project by holding conferences and after-work meetings n the topic.

Name of the engagement method (alias)	44. Q methodology - stakeholder selection (also called: Q Method, Q Methode, Q Methodologie)
Short description of the method	Controversial issues in public debates involve stakeholders and experts with a wide variety of viewpoints. The Q methodology is a research tool from the social sciences which can be used to gain insight into the diversity of perspectives. Furthermore, it can be used to select relevant participants for further dialogue about the issues at hand.
Long description of the method	The Q Methodology was developed in the 1930 by the psychologist William Stephenson to find correlations between diverse individual viewpoints. The method is applied by social scientists across a wide range of fields. In the Netherlands, a number of researchers have applied it as a tool to uncover perspectives on controversial subjects in the field of energy.
	Stakeholder selection When organising a dialogue, it is fundamental to facilitate the meeting of stakeholders with diverse viewpoints on the issue under discussion. Often the assumption is made that by selecting participants on the basis of their affiliation, a wide range of views is represented. The Q methodology can be a tool for stakeholder selection where the emphasis lies on the representation of diverse perspectives in the dialogue.
	Three step process The Q methodology involves three main steps:  1. Definition of the concourse When looking at a specific issue, the 'concourse' is the sum of all the statements about the issue. This step results in a set of statements called the Q-sort which defines the discourse. For example, in the Dutch biomass dialogue in 2007, there was an active public debate. So a desktop analysis of newspaper articles could be used to sketch the concourse. Sometimes this approach is not effective because of a lack of public debate. Then a different approach may be necessary. In a recent study on the acceptability of hydrogen technologies, focus groups were organised to gather data for the Q-sort.
	2. Interviews and perspective identification The sample of statements collected in the first phase is presented to the interviewees, who each make a Q-sort. This is a ranking of the statements in the Q-set according to their personal agreement or disagreement with the statements. At the end of each of the sessions the interviewer has two sets of data, the Q-sort and the narrative where the interviewee explains their choices.
	Figure 2: An interviewee making a Q-sort (Wikipedia)  The whole set of interviewees is called the P-set. They are selected to represent a variety of viewpoints. One purposive sampling approach is to snowball, by asking each participant for names of people with similar and different views. This can then be used to invite more participants and to monitor whether the interviewees
	represent groups with a wide variety of viewpoints.  3. Analysis & Conclusions  A statistical analysis of the Q-sort finds correlations between individual viewpoints. There are various software packages, such as PQMethod, that can support this analysis. Together with the analysis of the narrative, this leads to conclusions about the shared ways of thinking.
Objective of application of the method	☑ Policy formulation ☑ Programme development ☑ Project definition ☑ Research activity ☐ Others:
Results and products of the method application	<ul> <li>An overview of the variety of subjective perspectives on an issue;</li> <li>An overview of the participants indicating their affiliation and type of perspective. This can then feed the selection process for a dialogue on the issue at hand.</li> </ul>

See below for an example from the Dutch biomass discussion (Cuppen, 2010).

The six perspectives for the 75 participants from 6 actor types are: 1: Keep all options open; 2: Hit the brakes; 3: Support small-scale innovative initiatives; 4: Security of supply with global, certified, 2nd generation biomass; 5: Efficiency the goal: biomass a means? 6: Just do it, step by step. #### 45. Reflexive Interactive Design

(in Dutch: Reflexiefinteractiefontwerpen, RIO)

#### Short description of the method

In this method, stakeholders, consumers, NGO's and citizens define what the crucial characteristics of a sustainable production-consumption system are and then together design a production system that meets all these demands.

#### Long description of the method

The reflexive interactive design process consists of different stages, which could be seen as separate methods; the combination makes it unique and effective. This method is applied when sectors have arrived at a lock-in situation, where different stakeholders disagree on values or the nature of the problem. It is based on theories about systems learning, systems research and takes an integrative approach on problem-solving within unsustainable systems.

#### Interviews

Interviews are done with numerous stakeholders in the sector, as well as NGO's and the relevant ministry, to identify the sustainability problem(s) of the subsectors. Experts, guided by the project team, collectively analyse the current production-consumption system. They then create an IF-framework.

#### **Collective System Analysis (CSA):**

After the interviews are done, a workshop is organised. This CSA workshop is attended by participants that showed a willingness and ability to innovate and think outside the box during the interview. The aim is to get insight into the whole production-consumption system and especially to identify the main points where this system is blocking innovation and where possibilities for innovation lie. In the workshop, all participants write down the barriers they feel are blocking sustainable development on post-its. These post-its are placed on an Innovation Systems framework (a matrix showing the entire sector and all its interactions), while the participants explain them to the rest of the participants. Then, all participants reflect on the barriers listed, trying to determine the main underlying causes. In the next round, the same procedure is followed for current developments in or outside the sector, that offer windows of opportunity for innovation towards sustainability. At the end, one of the group members presents the results to the other groups in a plenary discussion and possible actions for improvement are proposed.

#### Design Atelier(s):

The interested participants from the CSA workshop, then come together for two days to:

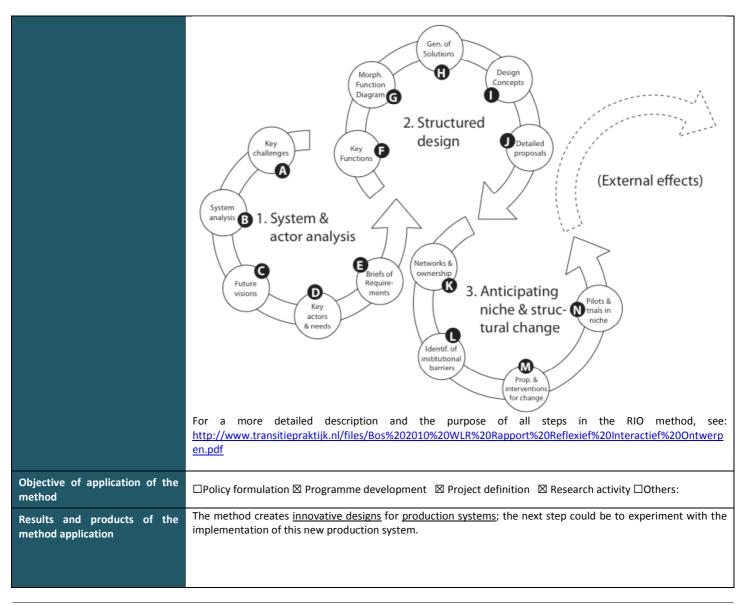

- 1) Identify what they feel are important characteristics of a sustainable production system;
- 2) Design a production system that meets these demands.

An artist is present and draws these designs at the end of the day.

In a plenary discussion these designs are assessed and pros and cons of the designs are identified.

This method provides a way to force stakeholders of a sector to come together with citizens and NGO's to actively analyse the situation they are in and to challenge the existing presumptions about the system. By bringing all stakeholders together, innovations can be made that would not be possible when the system 'naturally' progresses.

Depending on how the method is used and what the purpose of the project it is used in is, it could be used for working on the level of programme definition, project definition and/or for research activities. When it is used to make a design for a system that is then tested, it works on the level of project definition. When it is used as the main research method, and the research only aims to create a design, the participants actively participate in the research activity.

	In most of the projects listed at the end of this fact sheet, one or more of the designs that came out of the design atelier have been taken into practice and are being tested. This ROI method is developed by the WUF and has been used only by them – as far as we are aware. They have used the method in the agricultural secto to create innovations to make subsectors more sustainable. However this method might provide a way to also force other systems or technological sectors to come to new solutions for sustainability problems.

				l		

What are the issues of concern that organisers need to take into account when applying the method?

Crucial to this method is the selection of participants.

The willingness of the participants to cooperate and to find solutions together is a key condition for the workshops to be successful. Some stakeholders in a sector may not feel the need or may not be able to think outside the box. A balanced group of participants is important, but researchers have pointed out that creating a completely representative group is not only impossible, but may also be inefficient when trying to create innovative designs over a short period of time.

Preliminary interviews with potential participants serve to identify those parties that show a willingness to cooperate, innovate and think outside the box. These have an important role in choosing the right design atelier participants.

Knowing the sector in which you want to innovate and from which you want to choose participants is important, in order to be able to identify the bottlenecks in the sector in which innovation is being blocked or where there are possibilities for further innovation. So, overall, the preparation of the design atelier is essential in creating an efficient design process and a truly innovative product.

#### Long description of the method

The making of Resource Flow Maps allows researchers to gain insight into peasant farming systems by letting the farmers themselves draw a map of the resource flows. By using units of measurement they understand, farmers can better understand the quantities. It is a form of participatory action research which has been applied for decades in the agricultural sector in developing countries.

The method starts with large sheets of blank paper. Test farmers draw the different elements of their farms, such as fields, grain and fodder stores, animal pens, compost pits, etc. For each field, both present and preceding crops are noted. Afterwards, farmers draw arrows to represent resource flows entering and leaving the farm, and flows between fields and other farm components. It also includes the utilisation of last years' crop residues, organic manure and fertiliser application, and externally acquired resources entering the farm. The percentages of each of the different destinations of crop residues are estimated using pie diagrams. For transported material, quantification takes place in locally known units of measurement, such as donkey cart loads, bags or baskets. The arrows are labelled with the estimated quantities and percentages (Defoer et al., 1998).

An example of a Resource Flow Map. In the project these were drawn on large sheets of packing paper by the test-farmers themselves.

Objective of application of the method

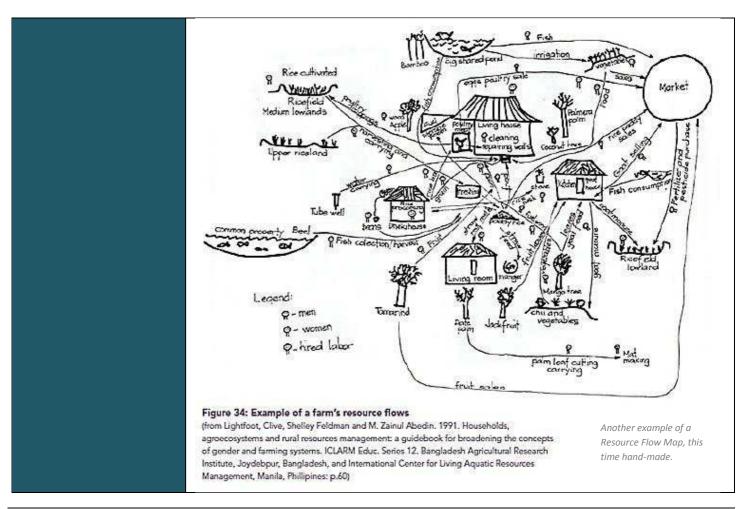

Results and products of the method application

 $\square$  Policy formulation  $\square$  Programme development  $\boxtimes$  Project definition  $\boxtimes$  Research activity  $\square$  Others:

By creating these maps, it is possible to visualise what the current state of the farming system is and how improvements can be identified. After the improvements are implemented, comparison between the past and current state are clearer.

When quantifying resource flows on the map with locally known units of measurement, it becomes possible to gather quantitative data on the resource flows.

In many citizen science projects, the intermediate results, and also conclusions, are relevant for all parties involved. This is the case here as the farmers gain knowledge about their own farming system and researchers gather data and insights to feed their research.

Name of the engagement method (alias)	47. Scenario Workshop
Short description of the method	The scenario workshop is an instrument for participatory planning, based on dialogue and collaboration between a group of local citizens, stakeholders, experts and policy makers. The method aims to stir dialogue, provide the opportunity for exchanging experience and knowledge about existing barriers and possible solutions, enhance the understanding on the central topic/problem of discussion, and facilitate consensus on proposed solutions among the involved groups.
Long description of the method	The purpose of the scenario workshop is to assess different solutions to a specific problem. The solution can be technical, regulatory or an alternative method to organise or manage a problem. The scenario workshop is a two day meeting involving 25-30 local representatives such as citizens, policy makers, stakeholders, technology experts and private sector representatives.  Before the workshop, a set of scenarios is developed and used as visions and inspiration at the scenario workshop. From these the participants develop visions in groups through discussion such as local plans of action to solve the problem.  Before the workshop  The organiser appoints an external planning group which comprises a number of people with specialist knowledge on the workshop topic. A set of scenarios is written, describing alternative ways of development. The scenarios represent different technical and organisational solutions with social and political values. Participants are carefully selected, and they are asked to read the scenarios beforehand.  During the workshop  The workshop is guided by a facilitator and the participants are divided in 'role groups' or 'theme groups' according to experience and interests. The workshop combines group work with brainstorm, debate, voting, presentation and plenary sessions. The process is divided into the following three phases:  Phase 1 'Critical analysis': The participants comment on the scenarios based on their views, knowledge and experiences, providing both positive and negative feedback and highlighting barriers. It should be made clear to participants that the scenarios are not predictions and the aim is not to select or assess the scenarios. The primary objective is to use particular scenarios to help participants develop their own visions.  Phase 2 'Vision making': Using the knowledge gained from the critical analysis phase, the visionary phase focuses on developing personal visions for future development. The participants' personal visions are discussed in the group. Each participa
	formulate different visions.  Phase 3 'Implementation': The visions have to undergo a process to become realistic, and the group has to consider barriers such as economic, cultural, social, organisational, political or technical. All groups present their ideas in plenum and there is time for discussion, clarification and priority. The visions turn into action proposals that are gathered in a final action plan. The action plan contains the visions with a focus on the solutions about implementation.
Objective of application of the method	☑ Policy formulation ☐ Programme development ☐ Project definition ☐ Research activity ☐ Others:
Results and products of the method application	<ul> <li>Direct results</li> <li>An action plan, including the created visions, and new ideas and recommendations for future actions, policies and initiatives.</li> <li>The method is a networking opportunity for citizens, stakeholders and policy makers, allowing them to interact, exchange knowledge and experiences, develop common visions and produce a plan of solutions for future action on a specific problem.;</li> <li>Historically scenario workshops have had some direct impacts on decisions taken.</li> <li>Indirect results</li> <li>The politicians can gain new knowledge about the citizens' discussions and assessment of technological development.</li> <li>The citizens gain new knowledge and awareness in a technological area.</li> <li>The method can contribute to better and more sustainable decisions in fields where future changes depend on the engagement and participation of citizens.</li> <li>The workshop brings people together who usually don't meet and discuss local problems. This can dissolve prejudices that can be a barrier in local issues.</li> </ul>

Additional information of relevance (such as historical background, where the method has already been applied, etc.)

#### Historical background

The Danish Board of Technology developed the method in the early 90's to meet the need for new and integrated ways of handling environmental problems – in connection to the project Barriers to Urban Ecology. The Scenario Workshop is a developed form of the "Future Workshop" and basically it follows the same three phases for criticism, vision, and fantasy. However, the Scenario Workshop is based on a presentation of possible future developments in the area - Scenarios - formulated in advance. The project resulted in a national action plan. Inspired by this plan, the Minister of Environment in Denmark established a national committee on urban ecology in 1993.

The Danish scenario workshop was later adapted for use across Europe as the European Awareness Scenario Workshop. The European Awareness Scenario Workshop (EASW) Initiative was launched by the European Commission DG XIII D in 1994 as a pilot action to explore new possible actions and social experiments for the promotion of a social environment favouring innovation in Europe. The EASW has been registered as a trademark since 9 June 1999.

#### Differences/alternative ways of implementing

It is possible to have the scenario workshop as a stand-alone event, but DBT recommends having several scenario workshops in the same project process. This can be done as independent workshops on the same topic with different scenarios. It can also be done in several workshops with the same participants developing the scenarios.

If time and resources allow it, the inclusion of citizens in the development of the scenario workshop, at the stage of design and selection of criteria for developing technology can be undertaken.

Some versions of the scenario workshops use voting. This is not necessarily a part of the method. Voting does not allow for the consideration of all valuable ideas and for working with them constructively.

It can be very useful to include a workshop in the process of writing the scenarios, where different kinds of experts contribute with knowledge, including: researchers, policy-makerss, NGOs, and others.

Name of the engagement method (alias)		of a CSO to a Researd all Science Shop Metho					
Short description of the method	The Intake (a structured conversation) of a Question from a CSO transfers it into a Research Question. It articulates the 'question behind the question' (the real problem), the objective and gives clarity on required timing and information already available.						
Long description of the method	The question a CSO may have to research is most often not yet a research question. In a conversation, preferably face to face, a research question can be articulated together. Usually, a mediator/broker, a researcher and a CSO representative sit around the table. Questions to be posed are: -For what purpose does the CSO need the question answered, what do they want to achieve with it and how? When do they need results for this purpose? (This should give clarity on the context of the issue, identify stakeholders, and decide whether research can be useful). It can be that their question is part of a wider problem (e.g. a CSO may ask for an inventory of complaints, but they may be interested in knowing possible solutions respondents have found as well; the survey will then need to be more extensive than just an inventory).  -What information is already available that they know of, and which steps have already been taken by them or others? What can the input of the CSO be during the research process or do they think it is possible to engage other stakeholders in it?  -What are their own hypotheses on the situation? (Data, correlations, causalities, possible solutions)  -Would there be additional funding options?						
	- Sometimes pre-ex specific group of course, there manalysis techniques they can be agolden be adding some more.	,,

Name of the engagement method (alias)	50. Integration of civil society driven research in university curricula (Tool – part of the Science Shop Method)
Short description of the method	Good and cost-efficient research for Civil Society Organisations (CSOs) can be done by integrating real-life research questions in the curricula of universities. This is a win-win situation where research and education is combined. When research is included in the curriculum of students, it will be cheaper because students have to obtain course credits anyway and professors have to supervise that already. At the same time young researchers gain valuable transferable employability skills and social/political awareness. Various options exist.
Long description of the method	When one wants to place research projects for Civil Society Organisations in the curriculum, various options exist.
	The first step is to identify curriculum elements already suitable for this. Check the course catalogue for words (depending on the situation) like:  Problem-based / Internship / Communication / Skills / Ethics / Multidisciplinary / Case / Interdisciplinary / Transdisciplinary / Applied / Research / Thesis / Colloquium / Participatory / Community / Social / Society / Public / Optional / Voluntary / Student selected / Environment / Sustainability / Energy / Health / etc.
	In a practicum, e.g., students may analyse real data instead of teacher-given. The disciplinary learning will be the same, with value added for the requesting organisation.  Internships could be undertaken at a CSO.  Most common is using the Bachelor or Master thesis research to do research based upon a question from a CSO.
	Occasionally, PhD thesis work can be used (though usually, PhD projects are not covered by regular financing of Higher Education and additional funds may be required).
	Smaller parts of projects may be handled by undergraduate students, either individually or in groups, such as collecting data or making a literature overview, if there is a course in which that is the learning objective. In some cases, doing research for civil society organisations can count towards skills portfolios.  Making research reports accessible may be an assignment for students in communication related studies, or even event organisation.
	If not enough suitable options are present, one can start new ones. For example, in student-selected compounds or optional courses one could start a new course, called 'research with and for society' and do a civil society driven research project in that. Alternatively, one can start a minor on that topic or set-up an honours course – usually the objectives of honours programs align quite well with solving real life issues.
	There are three main strategies to make the research project fit a curriculum part:  1) Chop up a project in smaller parts, for either parallel or subsequent processing by different students;  2) Employ a (multi-disciplinary) student-team in a group project;  3) Enlarge the project with a theoretical component so a more basic question gets suitable for thesis work (the original question then being one of the case studies being dealt with in the thesis).
	This is the core 'supply' of research capacity at university-based Science Shops (see separate Fact sheet).
Objective of application of the method	☐ Policy formulation ☐ Programme development ☐ Project definition ☒ Research activity ☐ Others:
Results and products of the method application	By doing research with students in the curriculum, this can be done cost-effective with added value for all. It helps students to achieve the competences required by HE standards (such as the Dublin descriptors and similar). For example, Duiblin descriptors require:
	-For Master level "problem solving abilities [applied] in new or unfamiliar environments within broader (or multidisciplinary) contexts", "the ability to integrate knowledge and handle complexity, formulate judgements with incomplete data", "communicating conclusions and the underpinning knowledge and rationale (restricted scope) to non-specialist audiences", and the ability to "study in a manner that may be largely self-directed or autonomous".
	-For Bachelor level "gathering and interpreting relevant data" and "communicating information, ideas, problems and solutions" and "skills needed to study further with a high level of autonomy" are required, and a PhD graduate should be able to do "critical analysis, evaluation and synthesis of new and complex ideas", and to "communicate with society in general (dialogue) about their areas of expertise (broad scope)"  Benefits for society are further mentioned in the Science Shop Fact Sheet (Civil Society Driven Research).  Science Shops apply this method broadly. See <a href="www.scienceshops.org">www.scienceshops.org</a> The Fact Sheet on Science Shops states the general advantages of the method to Civil Society.

What are the issues of concern that organisers need to take into account when applying the method?	Remember that stu not suitable. Of co	oint of attention: Timing of student schedule vs needs of CSOs.  emember that students need to learn; simple 'production work' (applying methods without question) is often ot suitable. Of course, this depends on the level of the curriculum element used (so for 1 <sup>st</sup> year students byiously different requirements apply than for 3 <sup>rd</sup> year students).

#### 52. Science Café Name of the engagement (also called: Café Scientifique - Kennis Café - Wissenschaftscafé) method (alias) A Science Café is an event organised in an informal setting as a place of dialogue with participants coming from Short description of the method all walks of life and academia. An expert presents a subject in a concise and open manner after which the floor is open for a discussion. The moderator facilitates the sharing of a wide range of views on the subject at hand. Across the world there are hundreds of Science Café Long description of the method events being held every month, excellently prepared in an informal setting. It is a meeting of minds and a dialogue outside of the usual spaces. Scientific experts are invited to give a short talk and then the floor is open for discussion. The Science Cafés are known under a number of different names and various flavours. Key ingredients are the bringing together of lay people and experts outside of an academic context. There is room for a presentation by an expert, but the event includes interaction and discussion. The organisers are usually not-for-profit organisations that regularly organise these events. Level of engagement Publishing findings is a major part of the scientific 4- A poster for a Science Cafe in Deventer (NL) process. Sharing knowledge with the general public by researchers is encouraged by many scientific institutions. Science Cafés offer an infrastructure for interaction which goes beyond informing the audience. In the faceto-face interaction, the experts have ample opportunity to gather responses to their message and take away new questions. Often this is a way to gather alternative views and relevant narratives, especially when the events focus on controversial issues. From the perspective of the general public, the science café is often seen as a place for gaining knowledge and forming opinions. The interaction is not only with the expert but also with the other participants in the discourse. Planning and roles Short films for organisers of science cafes on the involved practical issues are available on the ScienceCafe.org website. The events are usually less than two hours long and presentations by speakers should be short. These could be around 40 minutes, but some cafes limit it to five minutes in a total session of one hour. Some facilitators prefer presentations without slides to encourage a more informal interaction. Generally there is one speaker, but there are also models with multiple experts. A key ingredient is a moderator who should also prepare the experts to ensure there are lively and useful discussions. Objective of application of the □ Policy formulation ☒ Programme development ☒ Project definition ☒ Research activity □ Others: method New perspectives for all the participants in the events. Science cafes are designed to be inexpensive to plan and run. The major expenses associated with the events are the promotional materials.  The event is usually held in the evening and efforts should be made for publicity with posters, mailings, social media, etc. Usually the events are organised on a regular basis by a non-profit organisation. The practicalities of organising an event in a public space are not complicated but need to be done securely. The moderator has an active role during the evening but also needs to inform the expert during the invitation process on the approach and setup so that this can be included in the preparation of the presentation.  In general, the events are held on a regular basis at a specific location. Thus, the method has an element of being organised on a continuous basis. For a specific evening, the planning is mostly related to the timely invitation of the expert and having sufficient time for PR activities.  The events are usually less than two hours long and presentations by speakers should be short. These could be around 40 minutes, but some cafes limit it to five minutes within a total session of one hour.

What are the issues of concern that organisers need to take into account when applying the method?

Central in the concept of the Science Café is the informal setting and approach during the evening. This relates to many aspects of organizing the event. It starts with the selection of the location which needs to be outside of the regular research institutional setting. Science Cafés have usually been held in pubs, coffeehouses, bookstores, restaurants, and art galleries. The venue should be large enough to accommodate 30-50 people (the usual number of attendees) and at the same time small enough to allow the participants to hear each other and the presenters.

Not all experts can easily present and interact in an informal setting. To a certain extent the moderator can give guidelines, but some care should be taken in inviting people capable of interacting in this way. Therefore, the role of the moderator and expert are critical for the success of a Science Café event. Some Science Café's discourage or prohibit the use of PowerPoint presentations as this can create a formal lecture type atmosphere.

Long description of the method	being used in resea	•					
	Collaborations between artists and scientist are becoming more common in the UK as regular arts budgets are cut and funding from institutions such as the <u>Welcome Trust</u> and the <u>Science and Technology Facilities Council</u> are looking more attractive to artists. These collaborations also reflect growing pressure on scientists to communicate their research to the public. This is reflected in an increasing number of popular science events such as <u>The Brighton Science Festival</u> which combines elements of science communication and performance in a range of different events.						
	in a more traditiona on Forum Theatre/	al process. Theatre bas Theatre of the Oppress	ng complex topics to life, ed approaches to engage sed in Brazil in the 1970s out <u>health related issues</u>	ement have a long histo (Boal, 2000). Some par	ory dating back to work

Most 'science theatre' attempts to communicate science and technology to the public rather than engaging people in decision making. Usually the educators or artists present a play which is followed by a workshop. The aim of this is to allow participants to put what they have learnt into practice. Theatre is not always about transmitting knowledge. It can also be used to spark rich discussions around the social, ethical and political dimensions of a scientific or technological development and is often inspired by social crisis that is a result of scientific advancement (Priest, 2014). Science theatre uses the medium of participative theatre to explore					
	different views on scientific issues and ideas.  One attempt to take science theatre beyond just communication is the <i>Our Food</i> project which aims to allow citizens to explore the issues around global food security and provide an opportunity to shape policy in the UK. <i>Our Food</i> aims to contribute to the development of new ways for people with differing perspectives to talk together about the production and consumption of food with the intention of creating a research agenda that is based on collaboration between people with a wide variety of experiences and expertise. This process involved workshops which brought together a range of participants with an interest in food. Later, four actors dramatised and explored these issues raised in a performance. The play highlighted how people's desire for a healthy diet has been stifled for over a generation by a range of factors, including the narrow agendas of researchers, successive governments and the food industry. People were able to articulate their experiences and concerns during the workshops and the play, generating a list of topics to discuss with researchers and scientists in the

Name of the engagement method (alias)

54. Serious Gaming

Short description of the method

The primary objective of 'serious games' or 'applied games' is to train and/or educate the user. These games serve as tools for acquiring complex knowledge in fields such as health care, defence, education, engineering, city planning, emergency management, etc. Some serious games simulate real-life events and/or processes, thus providing the user with a problem-solving training environment. Furthermore, 'serious games' can be used in order to develop innovative products and services.

Long description of the method

#### **Gaming in household Energy**

Most 'serious games' have an element of education or training for the users of the gaming environment. In the Netherlands, a number of such games have been designed to entice the households to be more aware of their energy use, and to encourage other behaviour to reach a more energy efficient way of life. In a research project involving a number of households, home energy management systems were implemented which used a gaming environment to give feedback to the users in their homes. An example is the E-aquarium project of the Delft University of Technology:

Figure 6 - E-quarium - A game environment for energy visualization and advice (TU Delft)

"The E-quarium aims to bridge the gap between maximum (theoretical) efficiency gains and actual efficiency gains by providing consumers with an interface which is visually intuitive and engaging. Users are provided with meaningful context aware feedback by means of messages provided by the fish actor relieving the need for users to analyze their own energy data to benefit from the system."

Games are designed to be captivating. Successful games manage to find a good balance between developing skills and being challenged. The game simulates real-life events, or even monitors real-life actions, always with the chance of 'winning' (or improving your level) as the game element. The gamer learns through inquiry-based learning and experimentation. A basic idea behind the serious game approach is that this can be used to change behaviour.

#### Organising a serious game

The development of a game is a specialised activity. Sometimes games using ICT are first developed with simple game boards. Some games involve group interaction, but there are also online versions that can be played alone or in a group.

Additional information of relevance (such as historical background, where the method has already been applied, etc.)	Gamification as a trend  The Gartner group have analysed the trend of gamification across a number of sectors. Where gaming is a growing industry in the creative sector, they see an expansion to other fields, such as the gamification of innovation and knowledge management. The trend is supported by socio-technological developments, such as the ubiquity of internet access, location based services, and access to social media with mobile devices. This facilitates the integration of game mechanics, such as various types of incentives and rewards, into the daily lives of users.  Similarly to 'serious games', games like role playing, management games, and simulation games, have been used in education for a long time; the focus being learning and opinion forming of the participants. The look and feel, however, are not specifically aimed at being similar to currently popular 'games' that are played on smart phones, tablets or computers. However, these games may be modified for use by other groups, for learning, and opinion forming. This does not lead to a real engagement in the research and innovation process itself directly, but may raise awareness for people to better participate in the democratic decision making on science and technology related issues. #### **DISCLAIMER / DISCUSSION**

To what extent are the users of the gaming environment :

1. subjects of the studies

OR

- 2. actually engaged participants of an innovative design process?
- 3. active learners on relation of science/technology to solving Grand Societal Challenges

If it is only the first then for Engage2020 this cannot be qualified as truly engaged RR&I.

If it is only the third, this seems a grey area: true engagement or not?

#### What has been happening in other areas? Here some things on health:

http://www.gamesforhealtheurope.org/ - a conference

"Building on the successful editions in Boston (USA), Games for Health reached Europe in 2011. The non-profit Games for Health Europe is the official sister conference of the Games for Health project. Together with the USA organisation, we aim to bring serious gaming and healthcare together in order to contribute to more advanced healthcare across Europe"

### NOTE: Various projects use the expression 'Energy Battle'

You see this both in the project in Delft and Leeuwarden. But it is also used in another context where it is more a hackathon/big idea competition, competitions between other types of communities.

Name of the engagement method (alias)	55. User committee (also called: Valorisatie commissie, Valorisatie panel, Valorisation panel)							
Short description of the method	This method involve innovation process.	This method involves users and other stakeholders in the formal monitoring and steering of the researd innovation process.						
Long description of the method		This method involves users and other stakeholders in the formal monitoring and steering of innovation process.						
			m (NWO-MVI) has requir r-committee were given <sup>1</sup>		since 2009. In the 2014			
	"Applicants must always put together a valorisation panel and produce a valorisation plan. Besides representatives of the private partners, the valorisation panel includes all other actual and potential users and/or user groups. Relevant societal stakeholders can also be included in the valorisation panel. Also representatives from organisations that are willing to disseminate the research results and to valorise these among the target group that they represent can be included in the valorisation panel.  The valorisation panel is put together during the drawing up of the full proposal, is involved in writing the proposal, and remains involved in the project throughout its entire duration. More specifically, the valorisation panel's main task is to contribute its knowledge and expertise, and to confront the researchers with the everyday user practice, so that the researchers can incorporate this in their choices. At the very least it has a supportive role in:  articulating the research question; drawing up the valorisation plan; reporting about the research; disseminating and communicating the research results.  The valorisation plan is aimed at making the relevant research results available for and usable by top sectors (research priority conglomerates, ed.), societal partners and/or other interested parties from inside and outside of the established scientific community. Besides an overview of the costs associated with the valorisation, it also describes the role of the valorisation panel.  Applicants of research proposals awarded funding are required to organise an initial valorisation workshop immediately after the start of the project. The results of the first workshop will be monitored by the MVI Steering Group. Applicants from projects awarded funding will receive further information about this with the funding decision. They will also be informed about how the valorisation pathway will be monitored throughout the course of the project".

What are the issues of concern that organisers need to take into account when applying the method?

- Equitability of the process and expectations management. What is the real influence of the committee and its individual members?
- Representativeness of the committee (typically, there are many representatives of industry as 'users', instead of the end-user (the consumer); also, CSOs are underrepresented (typically, most NGOs that participate represent a branch organisation). There are exceptions of course. (Project summaries published in 2010 for the NWO-MVI program show 16 user committees. Of the total 135 member organizations, 21 can be classified a CSO. One project had 6 CSOs on 10 members; another project had no CSOs on 14 members). <a href="http://www.nwo.nl/binaries/content/documents/nwo-en/common/documentation/application/gw/responsible-innovation/responsible-innovation---project-summaries/Responsible+Innovation+%7C+Project+Summaries.pdf">http://www.nwo.nl/binaries/content/documents/nwo-en/common/documentation/application/gw/responsible-innovation/responsible-innovation---project-summaries/Responsible+Innovation+%7C+Project+Summaries.pdf</a>

Additional information of relevance (such as historical background, where the method has already been applied, etc.)

The method is probably used in many places, to various degrees of engagement, under various names. For example, it is known in ICT development.

Working in a supplier/user frame seems common for research to benefit industry; users will help guide the research.

The examples given here are from Dutch practice, given the fact that 'responsible' innovation has been a separate funding scheme of the national research council NWO since 2009. This extended the traditional user committee's mandate and composition, and led to an option for civil society engagement.

Sources (names of interviewees, links to relevant websites, etc.)

Jako Jellema participated in the Valorisation panel as an industry partner when he was working for 2-B Energy B.V., an offshore wind turbine developer. The panel also included a CSO, the North Sea Foundation, which is based in the Netherlands (www.noordzee.nl) <a href="http://responsibleinnovation.eu/research/mvi-project-offshore-wind-energy-systems/">http://responsibleinnovation.eu/research/mvi-project-offshore-wind-energy-systems/</a>

A very brief literature scan showed two hits on user committees that were more or less reflective, and could be used to think about user committees in responsible research and innovation. However, I suppose that there are more relevant studies somewhere in the STS domain. I would appreciate suggestions!

http://dx.doi.org/10.1287/isre.1.1.89 Information Systems Research 1 (1), 1990, pp. 89-113 is a paper describing and integrating 4 models of User Involvement as an Interaction Process (Michael Newman & Faith Noble, Department of Accounting and Finance, University of Manchester). User involvement is recommended to analysts as a technique of successful system development, but as a process it is little understood. This case study compares four process models of user involvement—learning, conflict, political and garbage-can-with each other and with an empirical example of system development. Different models are seen as appropriate to explaining

the nature of user involvement in different stages of development and contexts. Structural conditions and issues of power are shown to be decisive in the development of conflict and conflict resolution. A two-stage model of user involvement based on Robey and Farrow's work (1982) is proposed which distinguishes conflict development from conflict resolution.

http://dx.doi.org/10.1080/09578810410001688806 James Manor, in The European Journal of Development Research, Volume 16, Issue 1, 2004, describes user committees from their use in development co-operation, and signals that their composition are essential, if they are to truly give the end-users (local people) a say. User committees: a potentially damaging second wave of decentralisation?, pp. 192-213. Decentralisations in the 1980s transferred powers to multi-purpose local governments. In recent years, international donors and central governments are increasingly turning towards single-purpose user committees. Although these committees appear to be less democratically accountable and less representative than local government, donors view user committees as a mechanism to give local peoples greater say over the development decisions that affect them. Central government officials establish user committees at the insistence of donors but then manipulate them by selecting committee members and by reigning in their powers. This contribution explores how these proliferating single-purpose committees are undermining the democratic processes that were presumably institutionalised with the creation and strengthening of elected local governments in Third World countries. This new approach fragments local participation, reducing its coherence and effectiveness; the poor may even be worse off than before. These committees appear to usurp local government functions and deprive local governments of revenues. These myriad problems result in destructive conflicts and the undermining of local government authority.

Name of the engagement method (alias)	56. World Café
Short description of the method	World Café is a method for engaging groups, both within organisations and in the public sphere. World Cafés are based on seven design principles and a simple method. World Cafés should offer an antidote to the fast-paced fragmentation and lack of connection in today's world. It is founded on the assumption that people have the capacity to work together, no matter who they are.
Long description of the method	World Café is a method conducted in a workshop format which follows the principle of a good conversation, where anybody is able to talk about things that matter to them. In the 1990s it was created by Juanita Brown and David Isaacs who wanted to design a method that is based on two principles: first, humans want to talk together about things that matter to them and second, if they do, they could create collective power. The method design is based on the normative assumption that people already have within them the wisdom and creativity to confront even the most difficult challenges.
	World Café can be modified to meet a wide variety of needs. Specifics of context, numbers, purpose, location, and other circumstances are factored into each event's unique invitation, design, and question choice, but the following five components form the basic model. The setting should create an environment which is most often modelled like a café (including round tables with 4 or 5 chairs). The host should begin with a welcome and an introduction in the process and the "Café Etiquette". A World Café process begins with the first of three or more twenty minute rounds of conversation for the small group seated around a table. After the first round each member of the small groups moves to another table. One person will stay at the table and is a table host for the next round and briefly fills them in on what happened in the previous round. Each round of a World Café is prefaced with a question designed for the specific context and desired purpose of the session. After the small groups, the participants are invited to share results from their conversations with the rest of the whole group. These results are reflected visually in a variety of ways, most often using graphic recorders in the front of the room.
	Summed up, a World Café follows seven core design principles: (1) Set the Context; (2) Create Hospitable Space; (3) Explore Questions That Matter; (4) Encourage Everyone's Contribution; (5) Cross-Pollinate and Connect Diverse Perspectives; (6) Listen Together for Patterns, Insights, and Deeper Questions; and (7) Harvest and Share Collective Discoveries.
Objective of application of the method	<ul> <li>☑ Policy formulation ☑ Programme development ☑ Project definition ☑ Research activity ☑ Others:</li> <li>Open for all applications</li> </ul>
Results and products of the method application	A main result is graphic recording, which involves capturing people's ideas and expressions in words, images and colour. This documentation is created by the participants of the World Café. It allows the group's collective work to be shared with others as a framework and guide.  A further analysis is the basis for written and visual documentation of the methods results and recommendations. A personal presentation of these outcomes in the workshop provides the platform for a discussion of their practical consequences and implementation.
	World Cafés can create results to generate new ideas, to enable joint decision-making on key strategic issues, to discover new ways for collaboration, to reflect on the implications of a complex issue and in identifying specific step(s) for further exploration and implementation.

Name of the engagement method (alias)	57. World Wide Views (WWV)
Short description of the method	The purpose of the WWV method is to engage citizens in debates about important, but often complex, issues with the aim of giving advice to politicians. The method is designed to minimize the democratic gap between citizens and policy makers as more and more policy making becomes global in scale.
Long description of the method	Citizens at multiple sites debate the same policy related questions on a given issue on the same day. The citizens are given information material before and during the day and vote on a set of predefined questions. The votes are collected and reported online for comparison. The results are analysed and presented to policymakers.
	The WWV meetings  All WWV meetings are held all over the world at the same day. There are 100 citizens at each meeting. Before and during the meetings, the citizens receive detailed and accessible information to prepare them for discussion and voting.
	All meetings have the same format. The day is divided in 4-5 thematic sessions. Each session starts with an information video and groups of 5-7 citizens deliberate on questions assisted by a trained table facilitator with 5-7 citizens at table. After each session the participants vote on 3-5 questions.
	The votes are collected and immediately reported online. It is possible to compare the votes across countries, continents, gender, age and other criteria.
	All partners can choose a fifth and regional theme or let the citizens produce their own recommendations to the decision makers.
	Selecting the partners  The partners are responsible for organizing the WWV meetings in their countries or regions. The partners should preferably have some experience with citizen participation, be unbiased on the subject, able to follow the guidelines and able to self- or co-finance their participation in WWV.
	Questions and information material for the citizens  The information material is designed to present citizens with pros and cons of voting one way or another. The questions and issue information material is identical in all countries. A scientific advisory board is responsible for assuring the quality of the information material that covers an information booklet, information videos and questions.
	The web tool The citizens' answers are collected online at a web tool. The web tool has to show the results statistically with the function of comparison between countries, continents, gender and so on.
	Training of partners  The partners are responsible for having the meeting and selecting citizens, finding the right venue, translating the information material and getting financial support. The coordinators lead the partners through a training process preparing them to host the meetings and introduce the online web tool to report the results.
	Citizens  Participating citizens are lay people, chosen to reflect the demographic diversity within their country, with regards to age, gender, occupation, education, and geographical zone of residency (i.e. city and countryside). As non-specialists, citizens are in a unique position to weigh the pros and cons of different technological and political initiatives and to evaluate scientific progress from moral, social and cultural perspectives.
Objective of application of the method	☐ Policy formulation ☐ Programme development ☐ Project definition ☐ Research activity ☐ Others:
Results and products of the method application	Direct results  The results are based on views from citizens from all over the world. A WWV project produces a results web page. From the page it is possible to compare results across countries, development and developed countries, continents, age, gender, and much more.  The results are analyzed by the coordinators, communicated, and published in a results report.  The partners have this responsibility to present the WWV results and results report at a national level. Some partners make national reports as well.  The coordinators present the results and results report at a global level e.g. at UN conferences.

### Indirect results

The method creates a comprehensive political debate on citizens' views on a specific topic nationally and internationally.

The method has proved that it is possible to do successful citizen involvement internationally. This is the first and only method to achieve this.

By pointing out concerns and priorities central to the public understanding of the theme, the result can inform future policy initiatives. Furthermore, by examining public awareness on the theme, the results will also form an important baseline for future awareness raising initiatives.

Specific strengths and weaknesses of the method vis-àvis the challenge(s) addressed

#### Strengths

The WWV method can support and expand a democratic culture in governance by engaging and giving the citizens more political influence in countries with little or no experience or history with citizen participation. These organisations, decision makers and countries also develop capacity when contributing or involved in the project.

The method has established an international network of organisations capable of implementing international citizen participation.

The WWV meetings can engage a large and diverse number of citizens in discussions on political matters that affect a lot of people. It also increases the public awareness and opinion on a specific problem and engages different parties on political matters.

The method delivers a trans-national understanding of how citizens in the participating countries view the topic, and what they want to tell the policy makers.

The multisite aspects of the method gives the citizens the chance to discuss a theme with other citizens in their own language, at the same time as other citizens in a different part of the world are doing exactly the same. The meetings are connecting with skype during the day and the facilitator is able to announce and compare results from other countries as they tick in online. This creates a global sense of community for the participating citizens.

The method is capable of simultaneously addressing researchers and politicians at a national, regional and international level as some partner countries choose to have regional meetings.

The national face-to-face deliberations with comparable online results allows for more participating countries, than if you collected citizens from different nationalities at one venue.

The effect of the global meetings involving 3-4000 citizens allows areas of agreement and disagreement to emerge. This contributes to a transparency in important international debates and tells the political decision makers what they think about alternative political strategies.

Themes that contain obvious conflicts and dilemmas combined with well-documented scientific knowledge and a need for political action are well suited for this method. Combined with this, issues that need an international coordinated assessment are also ideal for this method.

The WWV method is not a campaign trying to tell citizens what they should think, but a method allowing citizens to tell policymakers what they think.

#### Weaknesses

It is difficult to give the citizens a meaningful co-influence on the themes and questions they discuss at the meetings.

The WWV process is expensive to carry out. Funding at a transnational level is difficult to obtain. The partner partially has to fundraise their own meeting and fundraising is challenging and comprehensive. This may exclude some partners if they are not able to fund the process and the meeting.

Since the meetings are global it is comprehensive and difficult to involve all relevant stakeholders and decision makers.

The WWV method is designed to address specific problems or projects that have reached a certain point. It may not be suitable for projects in early stages of development.

The WWV method is not suitable for projects and problems that do not have clear political options.

The method is not made to give the citizens the possibility to frame the following debate. The method has strict guidelines and the citizens have to navigate within the given rules.

Timeframe for the application of the method

The process requires 18 months of preparation.

- 1. month: The idea
- 1. month and onward: The WWV design

3. – 15. Month: Selecting the partners

5. month and onward: Production of questions and information material for the citizens

8. month: The web tool
13. month: Training of partners

14. – 17. month: Selecting the participating citizens

15. month and onwards: Contact to media

18. month: WWV day

18. month and onward: Making the citizens' views heard

What are the issues of concern that organisers need to take into account when applying the method?

Be prepared to apply considered amount of time and resources and to work with multiple languages and different political cultures.

The process requires a lot of coordination and is very time consuming.

### **Examples of use of the method**

Additional information of relevance (such as historical background, where the method has already been applied, etc.)

The WWV method was developed by The Danish Board of Technology and other partners in the World Wide Views Alliance which was established in 2007 for this purpose prior to the climate COP15 in Copenhagen in 2009. The aim was to develop a method that would be cheap and easy to use for partners in all parts of the world; a method that would produce results that could be easily communicated to policy makers; and a method that would provide participating citizens with balanced information and give them the opportunity to discuss the issues at hand with other citizens.

The method has achieved international recognition by the UN and considered to be both a means for awareness raising and a participatory endeavor. At COP11 in India in 2012 it was included in the final decision text to call on all countries to support projects such as the World Wide Views on Biodiversity.

The WWV is structured as a global alliance of institutions – public councils, parliamentary technology assessment institutions, civil society organisations and universities. The members of the WWV Alliance draw the overall methodology, questions to citizens, information material, media relations and contact to decision makers.

The results, video and background material has also contributed to educational courses and material at schools and science museums.
